# End User Deep Dive: **ALS Patients**

---

Of all neurodegenerative diseases, ALS involves one of the most widespread and diverse losses of function.

75%

of ALS patients ultimately require some form of Augmentative and Alternative Communication (AAC)

# Current Assistive Communication

## Eye

- Use the eyes as input
- About 10 words / min
- Most sustainable for ALS patients

## Touch

- Use touch as an input
- Not sustainable for limb onset ALS patients or as a long term solution for bulbar.

## Switches

- Use different inputs
- Not sustainable for limb onset ALS patients or as a long term solution for bulbar.

# Current Assistive Communication

## Eye

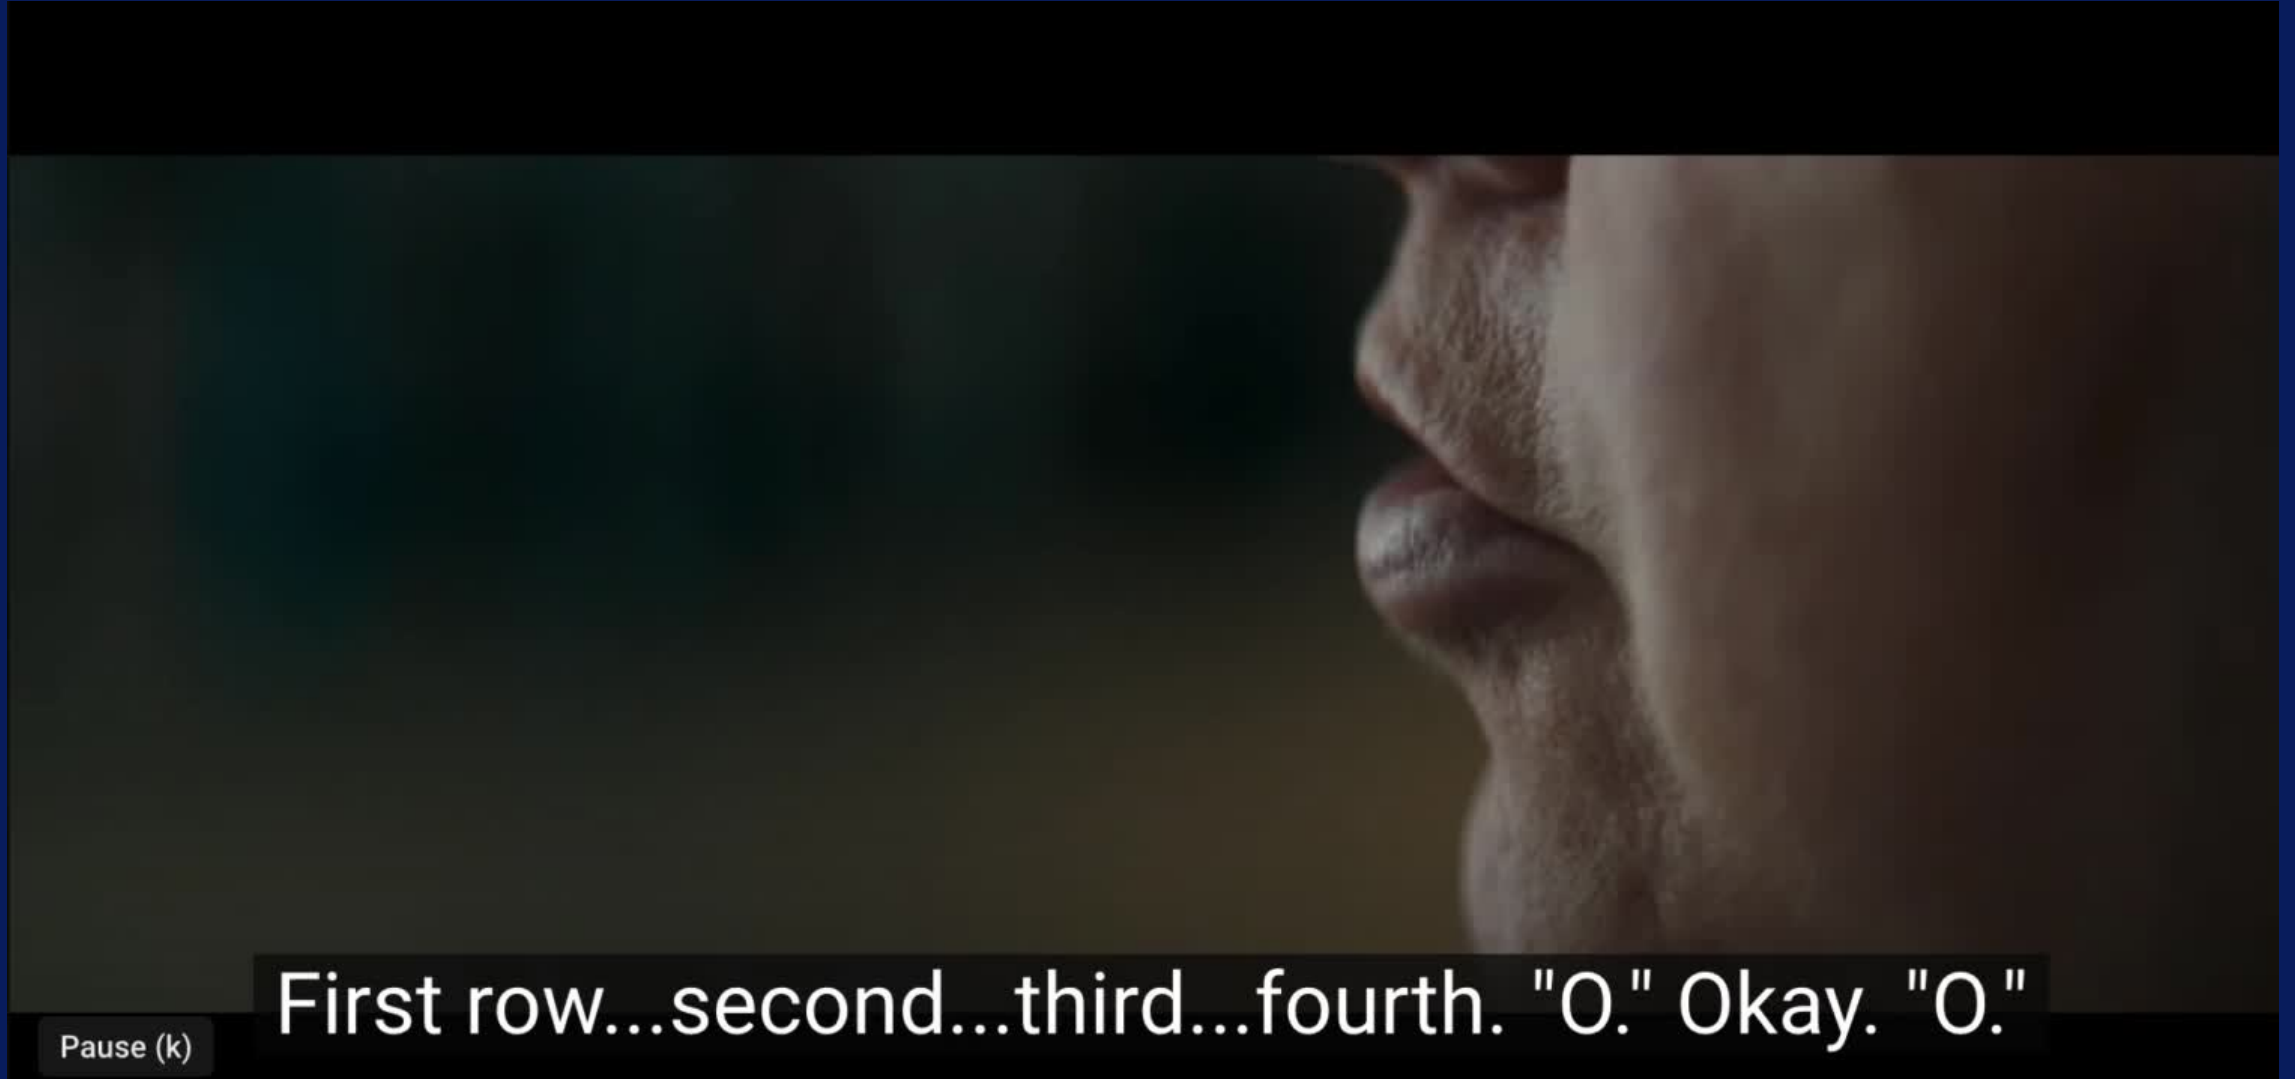

- Use the eyes as input
- About 10 words / min
- Most sustainable for ALS patients

# Current Assistive Communication

Nearly 70% of the ALS patients in a study were found to have at least one ocular symptom as shown below

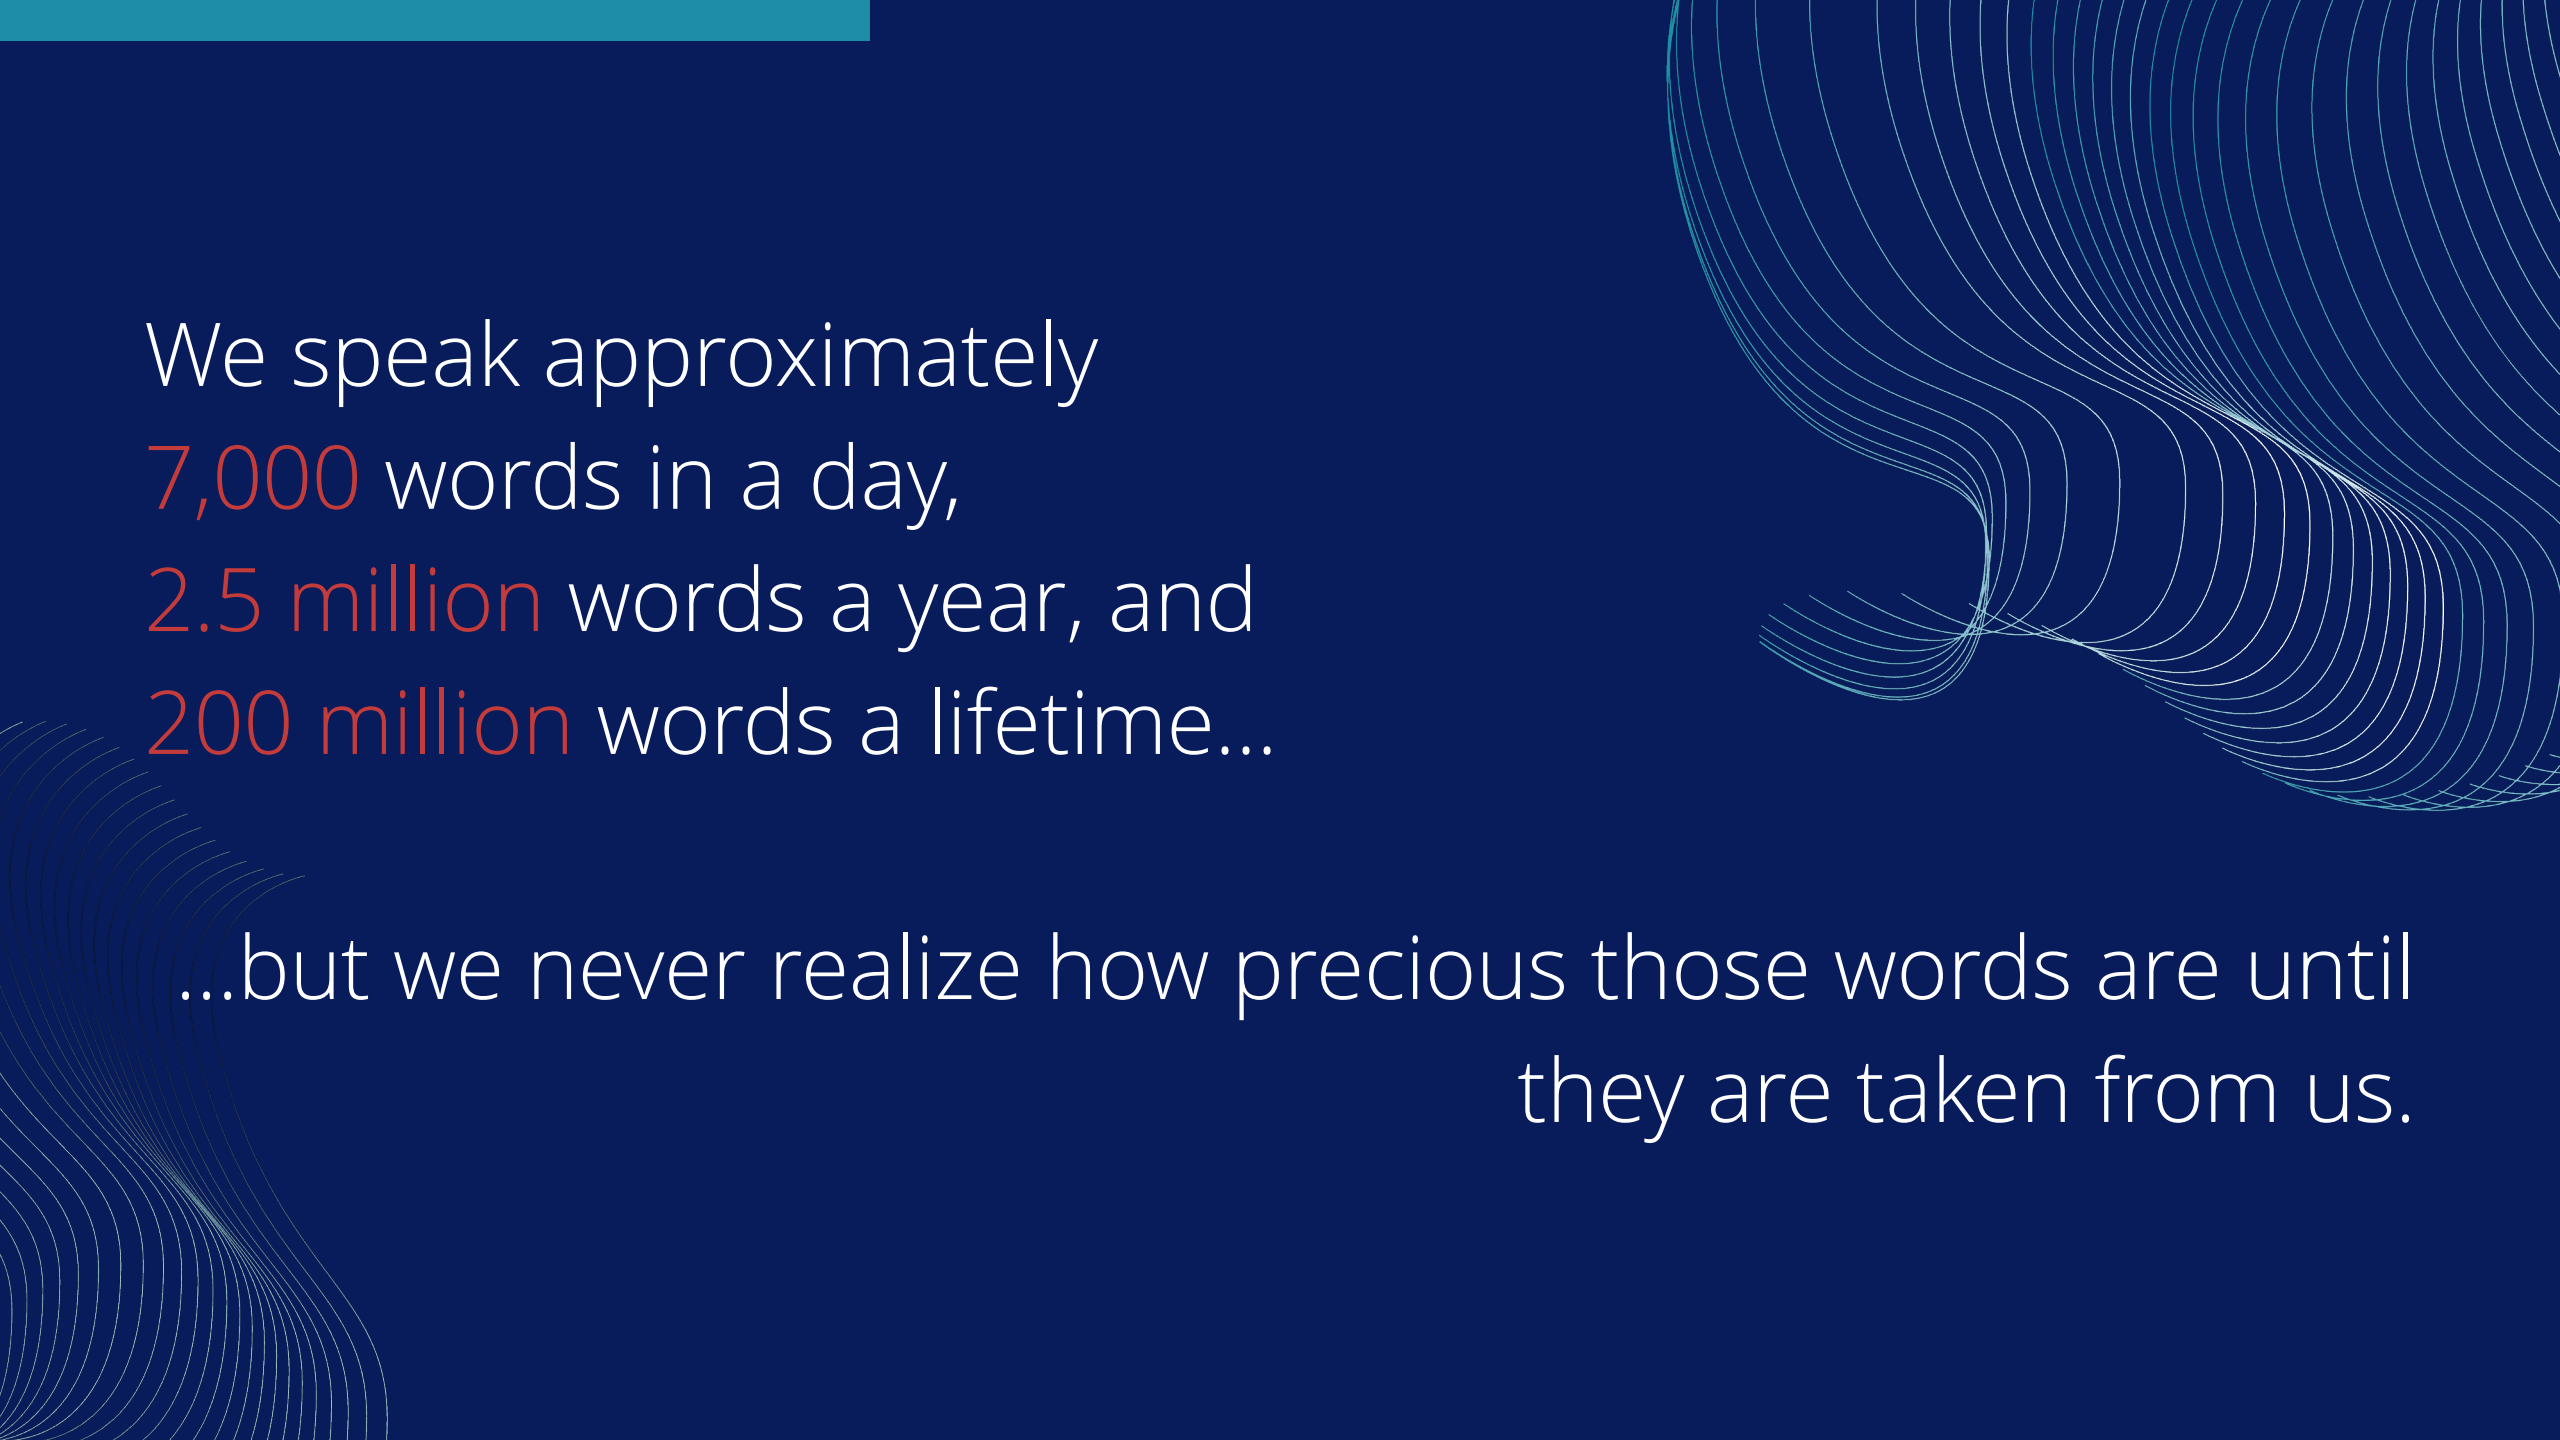

# The Reality of ALS

Government Investment & U.S  
Leadership in BCI

The top-left portion of the slide features a complex, abstract graphic composed of several thin, black, overlapping lines. These lines form a series of interconnected, irregular polygons and shapes, creating a sense of dynamic movement and geometric complexity. The lines vary in length and orientation, some extending towards the top and others towards the left edge of the frame.

# GOVERNMENT INVESTMENT & U.S LEADERSHIP IN BCI

Amy A Kruse, PhD

# MAN-COMPUTER SYMBIOSIS

The hope is that, in not too many years, human brains and computing machines will be coupled together very tightly and that the resulting partnership will think as no human brain has ever thought and process data in a way not approached by the information-handling machines we know today.

—J.C.R. Licklider  
Man-Computer Symbiosis

CYBERNETICS TECHNOLOGY DIVISION

PROGRAM COMPLETION REPORT

Program Title: Close-Coupled Man/Machine Systems Research  
(Biocybernetics)

Program Element(s): 61101E, 62709E

ARPA Order No(s): 3053, 3294, 3306, 3330, 3510

DARPA Agent: ONR, Directorate of  
Research Programs,  
Psychological Sciences  
Division

DARPA Technical Agent Key Proj  
Manager and Phone Number:  
ONR - Don Woodward/696-4257

The Program's goal was to develop new communication links between man and computer-assisted systems. These links, it was hoped, would enhance a man-machine system ability to perform its goals. This effort was seen as complementary to the main thrust of the development of computer applications in man/machine systems. In the main the traditional goal has been the development of tools that can take over some of the operators' functions by providing substitutes that can perform a large variety of functions. This "prosthetic" approach includes a diversity of developments, from the development of power steering mechanisms for efficient control of mechanical devices to the implementation of sophisticated Artificial Intelligence. The Biocybernetics Program was based on the presumption that no matter how wide spread, and successful, the application of computer-based prosthetic devices the operator will not be eliminated. Therefore, in all such systems, success will ultimately depend on the interaction between man and the mechanical contrivances which surround him in the man/machine system.

1. Direct man/machine communications through bio-electric signals, instead of traditional I/O or voice recognition and speech analysis for enhanced command and control.
  - (a) Could the brain make advantageous use of order of magnitude or greater increase in rate of information flow?
  - (b) To what extent can the brain act as time-shared or parallel processor?
  - (c) How far can non-invasive interfaces lead? Research and end products presumably were to involve only intact humans.
  - (d) Could same technology be applied to similar enhancement of man/man communications, perhaps by a central machine processor?

## Assistive Tech

Assistive Technology refers to any item, piece of equipment, software, or product that is used to increase, maintain, or improve the functional capabilities of persons with disabilities. Though the space has been around for some time, a new wave of companies are using emerging technologies such as VR/AR, artificial intelligence, and robotics among others to jump start innovation and offer more compelling solutions for disabled individuals.

In the consumer neurotechnology space, companies' claims have largely outpaced the science.

## Mind-Reading or Misleading? Assessing Direct-to-Consumer Electroencephalography (EEG) Devices Marketed for Wellness and Their Ethical and Regulatory Implications

Anna Wexler<sup>1</sup>  • Robert Thibault<sup>2,3</sup>

Received: 19 June 2018 / Accepted: 30 August 2018  
© Springer Nature Switzerland AG 2018

### Abstract

The market for direct-to-consumer brain health products—including brain-training games, neurostimulation devices, and consumer electroencephalography (EEG) devices—is expected to top \$3 billion by 2020. While many direct-to-consumer neurotechnology products have come under scrutiny from scientists and regulators, one set of products—consumer EEG devices—have largely escaped scholarly and regulatory critique. While these products do not present overt safety risks, by claiming to provide individuals with “snapshots” of their own mental states, they present a subtle, and arguably more complex, set of ethical issues. In addition, consumer EEG companies often explicitly or implicitly rely on studies conducted in the field of neurofeedback, a domain in which almost all adequately controlled studies point to little more than an interesting placebo effect. This paper presents an initial critique of consumer EEG devices, focusing only on devices that are marketed directly to consumers for improving their well-being. We categorize the behavioral and wellness-related marketing claims made by consumer EEG companies, analyze the evidence base for such claims, and argue that the ethical and legal issues wrought by these devices deserve greater attention.

Capabilities of neurotechnology are often overstated by the media.

SCIENTIFIC  
AMERICAN.

## The Machine that Reads Minds

“Today they are still secret signs, tomorrow they may perhaps reveal mental and brain illnesses, and the day after tomorrow, one may even be exchanging personal correspondence in brain script.”

# Die Maschine, die Gedanken liest...

## Die sensationelle Entdeckung eines deutschen Psychiaters.

### Elektrische Hirnschrift.

Von Walter Finkler.

Dunkelkammer der Psychiatrischen Klinik in Jena. Doppeltüren schließen den Raum schalldicht von der Umwelt ab. Eine bahnbrechende Entdeckung soll ausprobiert werden, die Professor Dr. Hans Berger, dem Direktor der Psychiatrischen Universitätsklinik in Jena, gelungen ist. Es handelt sich um die Aufzeichnung der Gedanken in Gestalt einer Zickzack-Kurve, um die elektrische Schrift des Menschenhirns.

Das Versuchskaninchen ist ein Assistentenarzt der Klinik. An Arm und Bein des Arztes wird eine Silberplatte

Das Elektroencephalogramm einer vierjährigen Säuglin (oben) sowie das eines dreißigjährigen Mannes (unten).

als das Zickzack, das ein Zeiger auf einem Papierstreifen aufzeichnet, und doch weiß man genau, wann der Mann im Nebenzimmer zu rechnen begonnen hat, ob ihn die Arbeit sehr anstrengt und wann er mit der Rechnung zu Ende ist.

★

Man hat bisher schon wiederholt versucht, die elektrischen Ströme des tätigen Gehirns nachzuweisen und glaubte auch positive Ergebnisse erzielt zu haben. Aber bei Nachprüfungen stellte es sich stets heraus, daß der elektrische Strom nicht der Lebenstätigkeit der Hirnzellen entstammte, sondern auf andere Vorgänge zurückzuführen war. Vor allem auf die elektrische Entladung, die durch die Reibung des Blutes an den Wänden der kleinen Blutgefäße entsteht, auf einen rein physikalischen Vorgang also, der mit den Hirnzellen und überhaupt mit Leben nichts zu tun hat. Oder der elektrische Strom rührte von Aktionsströmen der Blutgefäße her, bei deren Muskelaktivität ja auch elektrischer Strom frei wird.

Sorgsame Kontrollversuche haben ergeben, daß die elektrische Hirnschrift des Professors Berger mit allen diesen Erscheinungen nichts zu tun hat, denn die Kurven bleiben auch dann erhalten, wenn Herz und Atmung ausgeschaltet sind, wenn also gar kein Blutkreislauf im Gehirn stattfindet. Charakteristisch ist ferner, daß die Kurven während des Tiefschlafs abnehmen, ohne jedoch zu verschwinden. Damit ist ein experimenteller Beweis für die Lehren der modernen Seelenkunde erbracht, die annimmt, daß die Hirntätigkeit im Schlaf nie völlig aufhört.

Auf Grund von Tierversuchen und Beobachtungen an Menschen mit geöffneten Schädelknochen schloß man, daß diese Ströme in der Hirnrinde entstehen, jenem Teil des Gehirns, der als Sitz der höheren geistigen und seelischen Tätigkeit angesehen wird.

Stadt-Anzeiger, Dusseldorf, 8/6/1930

## BCI Commercialization

**Paradromics**

**Paradromics** is building a **direct data interface** with the brain to enable technology solutions to unmet medical needs

### About

- Founded in 2015
- Located in Austin, Texas
- \$18M public funding (DARPA and NIH)
- \$47 venture funding
- First-in-human expected Q1/2024

### Team

- Experts in neuroscience, microelectronics, computation, and advanced materials
- Experienced go-to-market medical device team with deep clinical and regulatory experience

### Technology

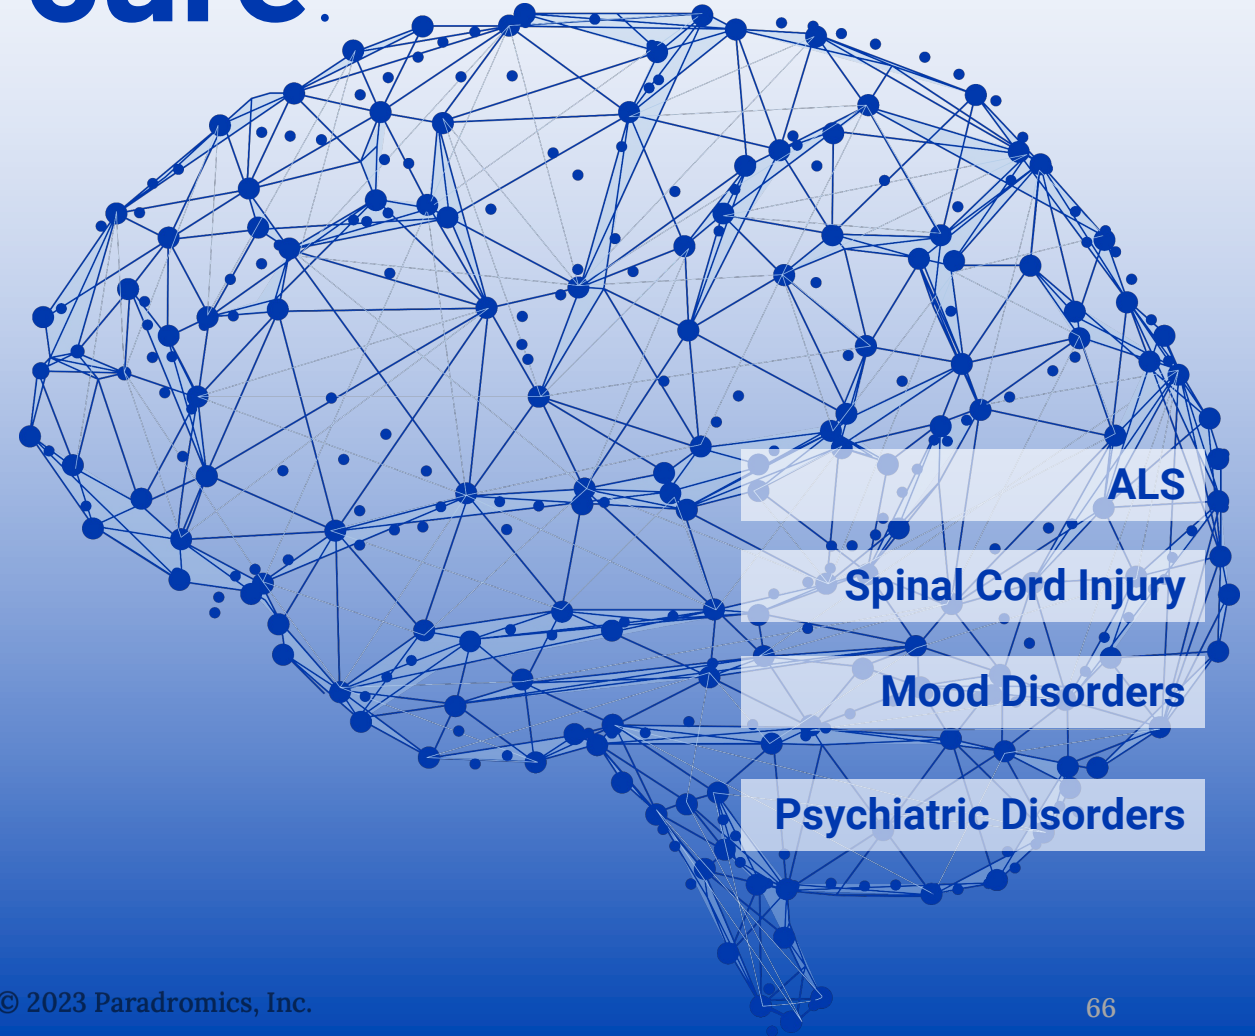

- Direct data interface - high data rate BCI
- 1600+ intracortical microelectrodes
- Wireless data and power transfer
- Long-term, everyday use

“Until there is a cure,  
**technology is the cure.**”

-Steve Gleason

Biological treatments for many conditions are nonexistent or insufficient.

Cures may be decades away.

# Our first product will help people to communicate

For patients with severe speech-motor impairment

## Connexus<sup>®</sup> Direct Data Interface

BCI-enabled

- typing
- cursor control
- speech generation

# Assistive communication rates today

BCIs can help people communicate through a computer

## Speech decoding: 62

2 Utah Arrays with 124 intracortical microelectrodes (Willett, et al., 2023)

## Two-handed typing: 40

## Imagined handwriting: 18

2 Utah Arrays with 192 intracortical microelectrodes (Willett, et al., 2021)

## Speech decoding: 15.2

128-electrode ECoG mesh on brain's surface; 50-word corpus (Moses, et al., 2021)

## Gaze tracking (no BCI): 9.51

Cascading dwell gaze typing (no BCI) by ALS patients (Mott, et al., 2017)

## Cursor Control BCI: 5.6-7.8

1 Utah Array with 96 intracortical microelectrodes (Pandarinath, et al., 2017)

## Cursor Control BCI: 2.7-4.02

16-electrode Stentrode + gaze tracking in ALS patients (Oxley, et al., 2021)

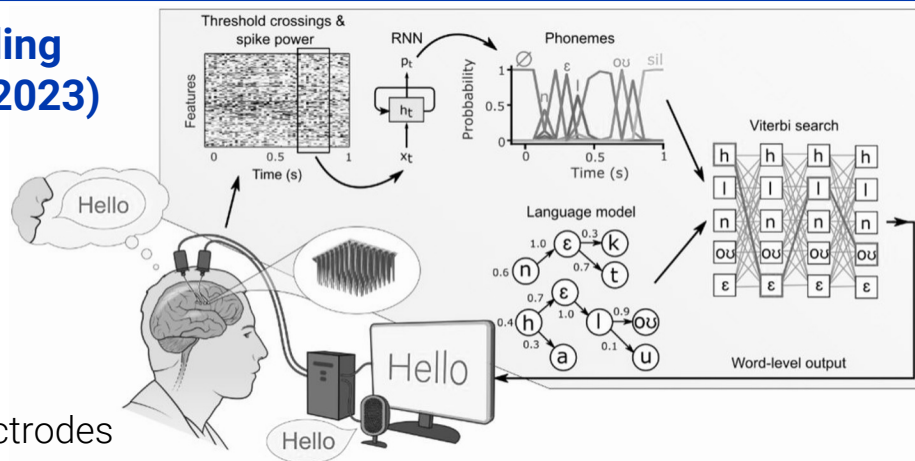

# Conversational speech through BCI communication

Even better with higher channel-count **intracortical electrodes**

## Speech Decoding (Willet, et al., 2023)

**62**  
WPM  
**23%**  
word-error rate  
**124**  
Intracortical electrodes

Word-error rate vs. # of intracortical electrodes

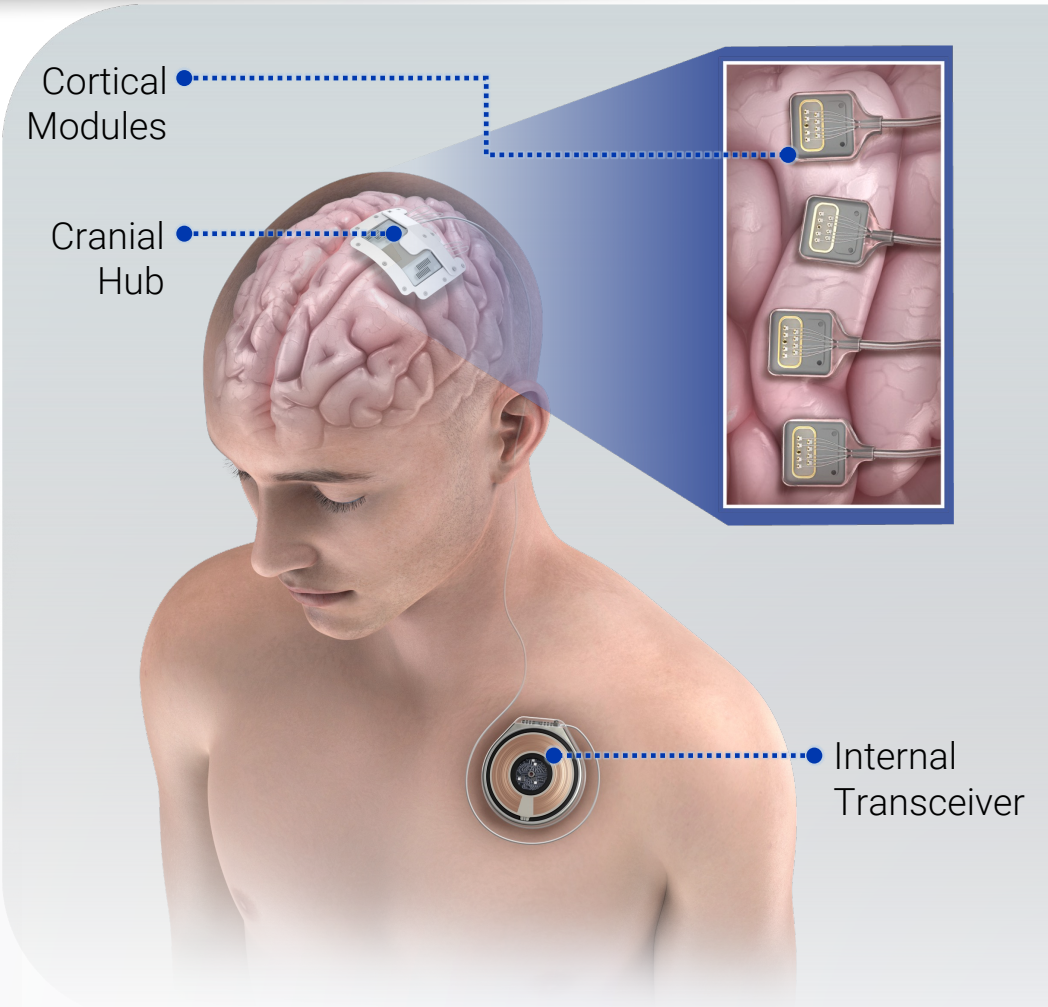

“a higher channel count system that records from only a small area of [the motor cortex] is a feasible path forward towards a device that can **restore communication at conversational speeds to people with paralysis.**”

**1600+**  
**intracortical**  
**electrodes** → **> 62 WMP**  
**< 1.9% error**

# Connexus<sup>®</sup> Direct Data Interface System

BCI-enabled **medical device** supporting advanced applications

# Connexus<sup>®</sup> Cortical Module

**Leveling up** the microelectrode array

400+ electrodes per module for **higher data rate**

< 40- $\mu$ m diameter PtIr microwires for improved **reduced tissue impact**

Durable ceramic coating for **biostability**

**Hermetic** metal-ceramic feedthroughs for **long-term reliability**

Patented on-chip processing for dramatically **reduced power consumption**

Active ASIC multiplexes high channel count array to a **surgeon-friendly flexible, 8-wire lead**

Compatible with **standard medical device connectors**

# More cortical coverage. More data. More capabilities

**Scalability** to support up to 4 cortical modules and 1600+ electrodes

## Cranial Hub

Housed in the **cranioplasty**

Multiplexes **4 cortical modules** onto one easy-to-manage lead

Zero suppression **data compression** for sparse output

Moves processing power away from the brain for improved **thermal management**

**1600+**  
**intracortical**  
**electrodes**

# Connexus<sup>®</sup> Transceiver wireless coupling

**No through-skin ports or wires**

## Internal Transceiver

Implantable pulse generator (IPG) form factor is **familiar to neurosurgeons**

Data transmission **up to 100 Mbps** with 850 nm near-infrared optical link

## External Transceiver

Lightweight wearable

Inductive power transfer up to **500 mW**

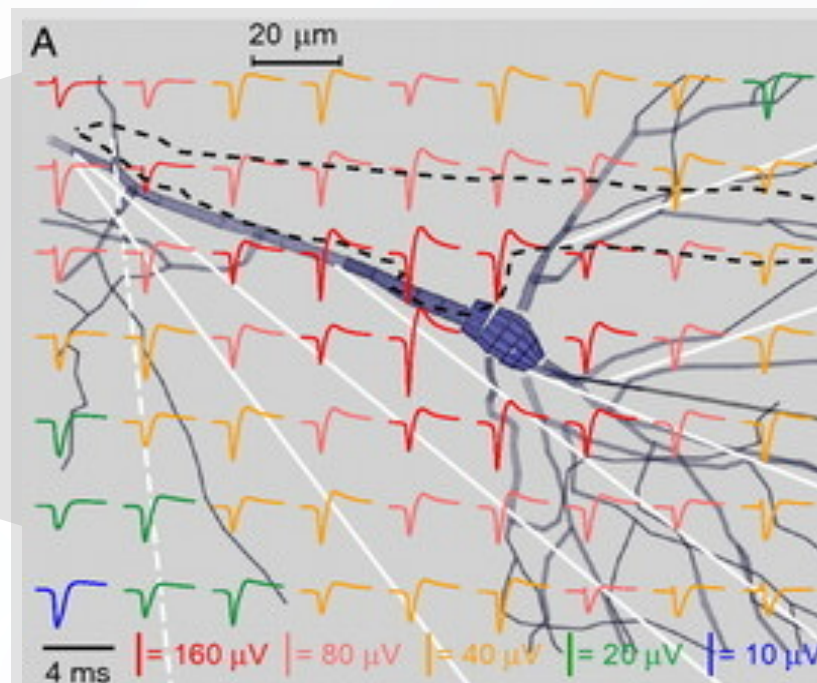

# Why do we need microelectrodes “in” the brain?

## Design rationale for Connexus<sup>®</sup> Direct Data Interface

Ranjandish and Schmid, *Sensors*. 2020; 20(19):5716.

Only **intracortical** electrodes can gather signals from **single neurons**

Gold, et al., *J Neurophysiology* 2006 95:5, 3113-3128

Thickness of one sheet of paper

- Signal amplitude decreases as distance from the neuron increases (Gold, et al., *J Neurophysiology*, 2006)
- Increasing intracortical electrode density increases signal recovery
- Increasing surface electrode density yields diminishing returns

# Path to first-in-human use

## Key Milestones

**Q2/2023** Begin pre-clinical Large Animal Safety Study

**Q4/2023** Approval of Early Feasibility Study

**Q1/2024** First patient enrolled in Early Feasibility Study

# synchro

Brain Computer Interface

# Precision

U.S. Department of Commerce

February 27, 2023

## Overview

1. Precision Neuroscience is a medical device company developing a brain implant.
2. Devices like ours are focused on changing the lives of people with neurological disorders... with potential defense applications likely many years away.
3. Creating a successful company developing a Class III medical device is extremely challenging.
4. The U.S. Government can support American companies' efforts, rather than constrain market access and increase regulatory burden through *premature* policy action.

Precision Neuroscience is a medical device company developing a brain implant.

# Brain-computer interfaces are beginning to treat “untreatable” diseases

Senior Software Engineer, ex-Apple

**M. LaMarca**  
Senior Biomedical Engineer, ex-Neuralink

Devices like ours will change lives.

“I'm a C6 incomplete quadriplegic... I have a son—he's almost 11 years old—and I **would love to get out of this wheelchair and into his life!**

There's nothing I wouldn't do to get my independence back! ”

“I am 25 years old... I was in a car wreck... I suffered... a spinal cord injury....

I would desperately love to be a part of this trial. The things I miss the most are bartending & walking in the woods with my dogs. I have fought so hard to get to where I am & I assure you that I will do whatever needs to be done to make this work.”

**“I’m a 29-year-old quadriplegic! I was injured in an... accident in... 2016 leaving me a C5 complete quad. I would love to participate in your program.”**

# Implantable Brain–Computer Interface Uses

## Medical Necessity

### Back to Work

People suffering from paralysis, stroke, traumatic brain injury, neurodegenerative disease seeking to regain function

## Everyday Enhancement

### Enhancing Work

Able-bodied people seeking to increase efficiency and performance

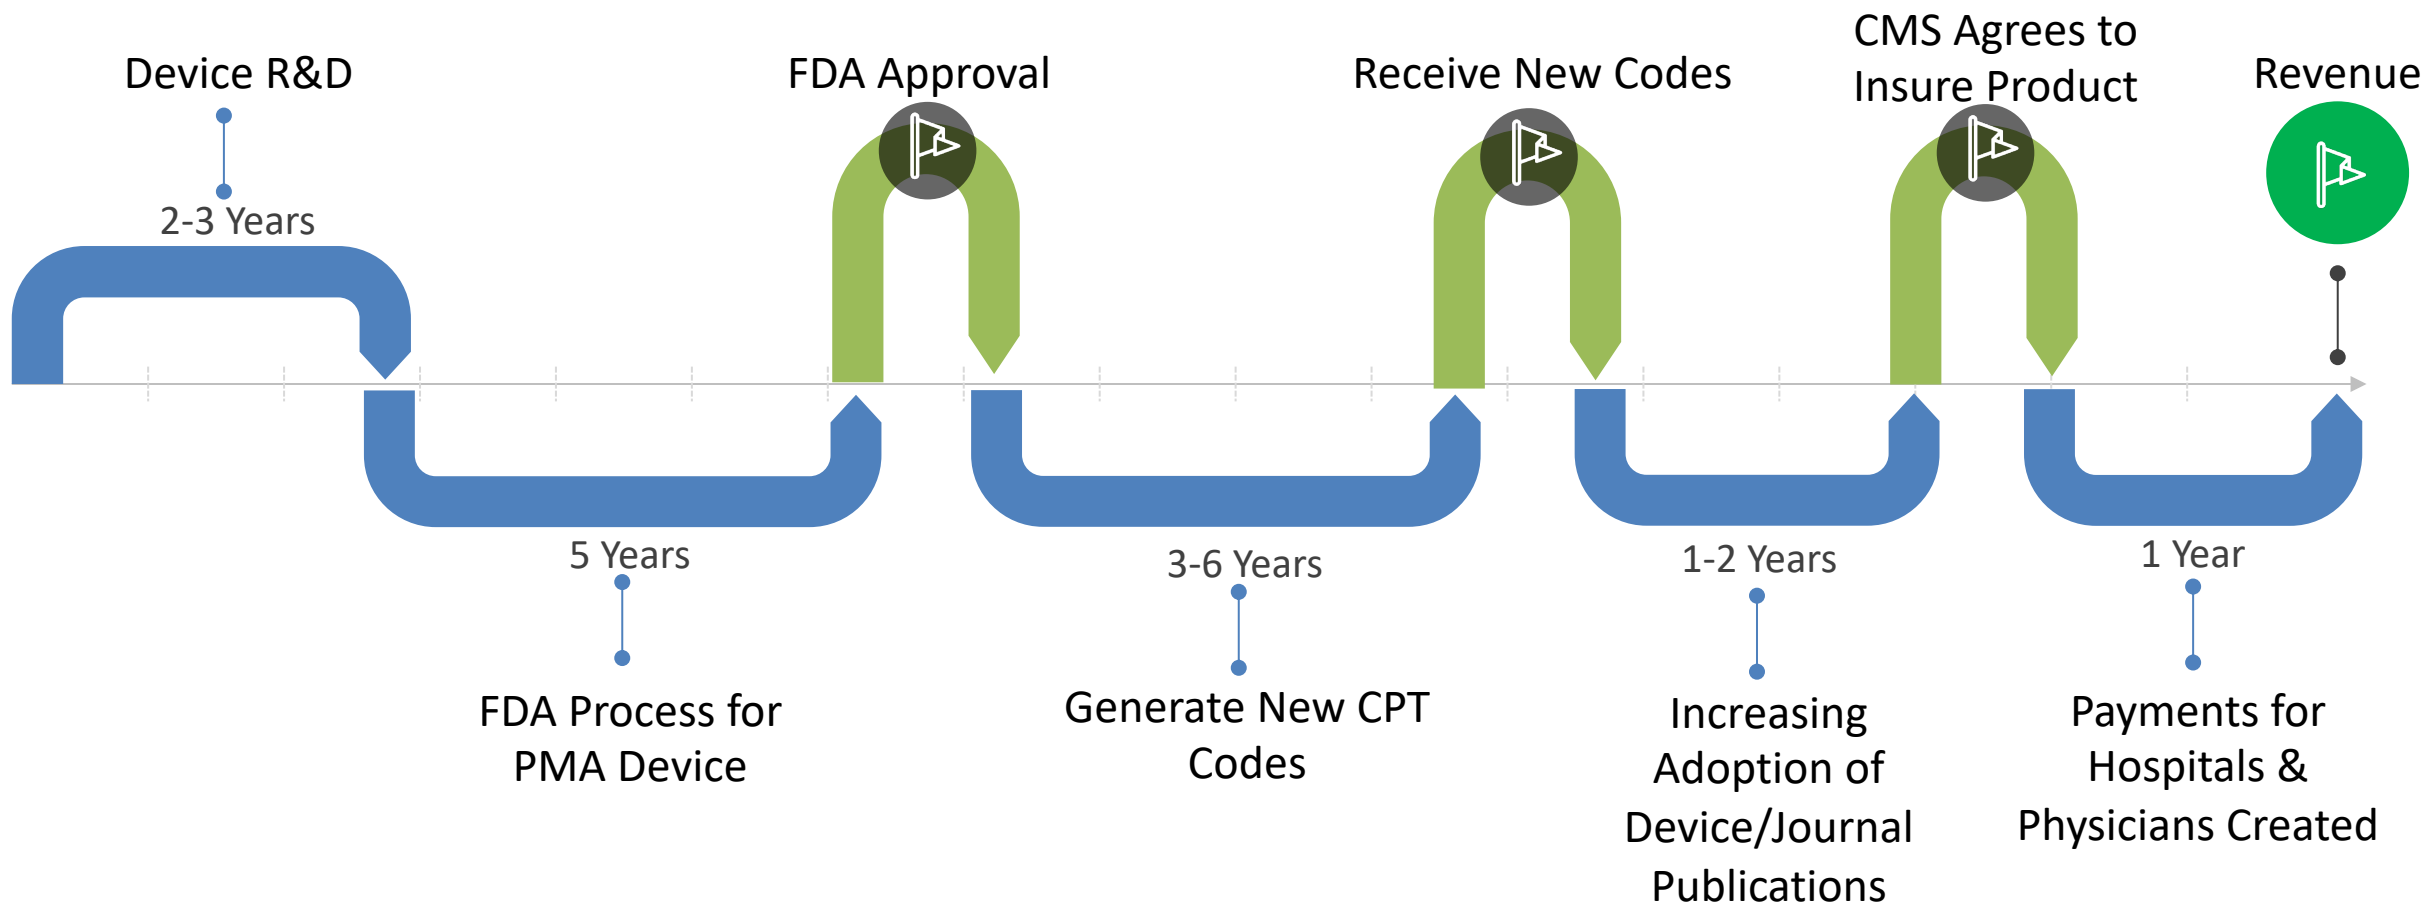

## Military Augmentation

### Potential Military Uses

Augmented decision-making, integration with military technology systems, control of unmanned aerial vehicles

Creating a successful company developing a Class III medical device is extremely challenging.

# Implantable device roadmap: 12 - 17 years

Source: Stanford Biodesign Textbook

## The process favors established players

In the last 40 years, only 20 new implantable neurotechnology devices have been cleared for sale in the U.S. Of these, just 12 were developed by startups or small companies.

- 1981 **Cordis** spinal stimulator (pain)
- 1982 **EBI, L.P.** Scolitron Stimulator (Scoliosis)
- 1984 Medtronic Intrel(R) spinal stimulator (pain)
- 1994 **Sigmedics** Parastep 1 functional neuromuscular stimulation (walking)
- 1995 **Biocontrol Technology** Neurocontrol Freehand System (hand function)
- 1997 **LivaNova** VNS (vagus nerve stimulator) system (epilepsy)
- 1997 Medtronic Activa Tremor System (Parkinson's Tremor)
- 2001 Abbott/Advanced Bionics Genesis and Eon Neurostimulator (pain)
- 2004 Boston Scientific Precision Spinal Stimulator (pain)
- 2012 **Codman** MedStream Infusion System (spasticity)
- 2013 **NeuroPace** RNS System (epilepsy)
- 2015 Abbott Brio DBS System (Parkinson's)
- 2015 **Nuvectra/Greatbatch** Algovita Spinal Stimulator (pain)
- 2015 **Nevro Senza** Spinal Stimulator system (pain)
- 2017 Boston Scientific Vercise DBS (Parkinson's)
- 2018 Medtronic DBS System (epilepsy)
- 2019 **Saluda Medical** Evoke Spinal Stimulator (pain)
- 2020 Medtronic Percept (brain recording)
- 2020 **Mainstay Reactiv8** Spinal Stimulator (pain)

Companies in **red** denote small companies/startups.

The U.S. Government can support American neurotechnology companies to help them compete globally. Export controls would do the opposite.

## U.S. Government support is dwindling

Source: Sino-American Tech Trap, Project Syndicate

Meanwhile, China has made developing BCI a national priority

Excerpt from the “14<sup>th</sup> Five-Year Plan for National Information,” published in 2021 by China’s Central Commission for Cybersecurity and Informatization

布局战略性前沿性技术。瞄准可能引发信息化领域范式变革的重要方向，前瞻布局战略性、前沿性、原创性、颠覆性技术。加强人工智能、量子信息、集成电路、空天信息、类脑计算、神经芯片、DNA 存储、脑机接口、数字孪生、新型非易失性存储、硅基光电子、非硅基半导体等关键前沿领域的战略研究布局和技术融通创新。

Deploy strategic advanced technologies. Aim at important directions that may trigger changes in informatization areas and forms; arrange strategic, forefront, originally created and disruptive technologies in a forward-looking manner. Strengthen strategic research deployments and scalable technological innovation in critical and advanced areas such as artificial intelligence, quantum information, integrated circuits, aerial information, neuromorphic computing, neural chips, DNA storage, **brain-machine interfaces**, digital twinning, novel non-volatile storage, silicon electrons, non-silicon semiconductors...

China's efforts are paying off, attracting American investors

## Chinese BCI Startup NeuroXess Bags Tens of Millions of US Dollars in Fundraiser Led by Zhongping

TANG SHIHUA 

DATE: DEC 28 2022 / SOURCE: YICAI

In January, the Chinese BCI start-up said it has raised 97 million yuan (\$15.2 million) in funding from major investors Shanda Group and Sequoia Capital.

Shanghai Hongqiao International CBD  
@shhqcbd

...

NeuroXess is a brain computer interface (#BCI) company based in #Shanghai #Hongqiao Intl CBD. "Our main competitor is @neuralink, run by @elonmusk," said Phoenix Peng, Founder and CEO of NeuroXess. Watch the preview and stay tuned on @shhqcbd for more! @sinoprise @InvestShanghai

**China self-develops brain-computer interface to bypass US tech sanctions**

Chinese researchers have had to be innovative to develop working BCI applications, despite tech supply chain limitations in recent years. (Photo by SAM YEH / AFP)

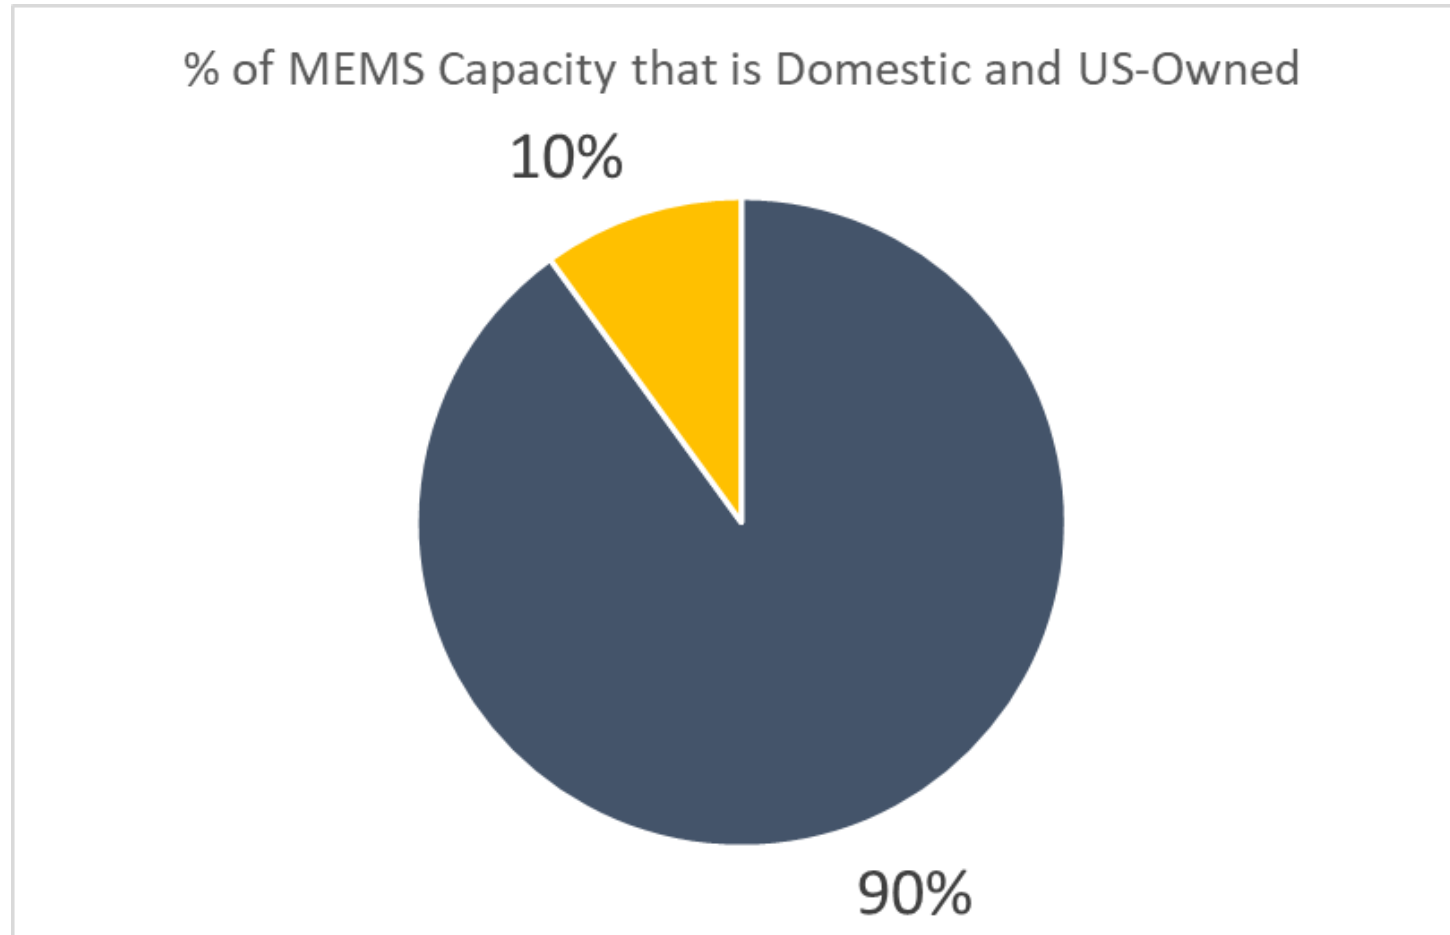

Export controls would limit the ability of American BCI companies to do the following:

- X Hire specialized talent from overseas
- X Access global capital
- X Access global supply chains and critical manufacturing facilities

The days of handmade medical devices are ending. Manufacturing for devices such as ours must be done with high-precision machining called MEMS (microelectromechanical systems)

The vast majority of MEMS capacity is overseas and/or foreign owned

Source: Yole Development, Status of the MEMS Industry 2021, Internal Estimates

February 27, 2023

Ways that the U.S. Government can support the emerging American BCI industry:

- ✓ Expedite the typical timelines for FDA approval and insurance reimbursement.
- ✓ Facilitate the American BCI industry's access to global talent and capital.
- ✓ Enable BCI technologies to qualify for CHIPS Act and other grant and incentive programs.
- ✓ Encourage the adoption of technologies produced by American companies at U.S. Government medical facilities.

## Presentation Summary

1. Precision Neuroscience is a medical device company developing a brain implant.
2. Devices like ours are focused on changing the lives of people with neurological disorders... with potential defense applications likely many years away.
3. Creating a successful company developing a Class III medical device is extremely challenging.
4. The U.S. Government can support American companies' efforts, rather than constrain market access and increase regulatory burden through *premature* policy action.

# CONSUMER ADVISORY BOARD (CAB)

Our CAB, composed of people with tetraparesis/tetraplegia, offers guidance at every stage of our development process to maximize usefulness of our device for end-users

## 2021 SCI Community Survey Results

Preferences for the future applications below were equally distributed among respondents:

<i>Physical therapy</i>	<i>Environmental controls</i>	<i>Bed/mattress control</i>
<i>Health &amp; safety</i>	<i>Biometric monitoring</i>	<i>Car</i>
<i>Robotic arm</i>	<i>Wheelchair</i>	<i>Entertainment</i>

## Other Example Areas of Guidance

- Expectations and preferences around device charging
- Requirements for the BCI application user interface
- The current market for assistive technology for people with SCI

# Brain Computer Interface Export Controls Conference

February 16-17, 2023

## Q&A

### BCI Commercialization Part I

# **ONWARD<sup>®</sup>**

**EMPOWERING MOVEMENT**

**Export Controls for BCI Conference  
February 16-17, 2023**

**Erika Ross Ellison, PhD  
VP, Global Clinical & Regulatory**

# ONWARD at a Glance

## Key Facts

- Founded in 2015
- 100+ FTEs<sup>1</sup>
- HQ in Eindhoven, the Netherlands
- Science and Engineering Center in Lausanne, Switzerland
- Growing US presence centered in Boston, Massachusetts
- IPO 2021, Euronext Brussels and Amsterdam; \$150M+ raised since inception

- Technology - 2 purpose-built investigational neuromodulation platforms that stimulate the spinal cord with implantable (ARC<sup>IM</sup>) or external (ARC<sup>EX</sup>) technologies
- Innovation - 7 FDA Breakthrough Device Designations and 330+ issued or pending patents
- Clinical Validation - One pivotal trial complete with positive top line results reported for ARC<sup>EX</sup>; positive interim outcomes also reported for ARC<sup>IM</sup> blood pressure indication
- Commercialization - Large Total Available Market (\$20B+); first commercial sale expected in H2 2023; favorable reimbursement for ARC<sup>IM</sup> in the US; strategic relationship with Christopher Reeve Foundation

<sup>1</sup> As of 01 December 2022

# Large unmet need: There is no cure for Spinal Cord Injury (SCI)

# Problem

## Devastating

Not only paralysis & loss of sensation; frequently also infection, incontinence, loss of sexual function, and other challenges

Assistance required to support activities of daily life

Quality of life changes

## Prevalent

### US & Europe<sup>1,2</sup>

Prevalence ~650,000

Incidence ~50,000

### Global<sup>2</sup>

Prevalence ~7,000,000

Incidence ~768,000

## Costly

### Avg Lifetime Cost (paraplegic)

**\$2.5M**

### Avg Lifetime Cost (tetraplegic)

**\$5.0M**

<sup>1</sup> NSCISC Annual Report, US and Europe only – with 25 years old patients, World Health Organization Fact Sheet, November 2013, estimate 40-80 cases per million.  
<sup>2</sup> Kumar et al. 2018, Traumatic Spinal Injury: Global Epidemiology and Worldwide Volume – Traumatic spinal injury may be broader than traumatic spinal cord injury.

## ONWARD ARC™ Investigational Therapies

**ARC** **EX**™

Non-Invasive Platform

External system for non-invasive, programmed stimulation of the spinal cord

## Our Solutions

**ARC** **M**™

Implantable Platform

IPG and leads for direct, programmed stimulation of the spinal cord

External investigational system for non-invasive, programmed stimulation of the spinal cord

# External Platform

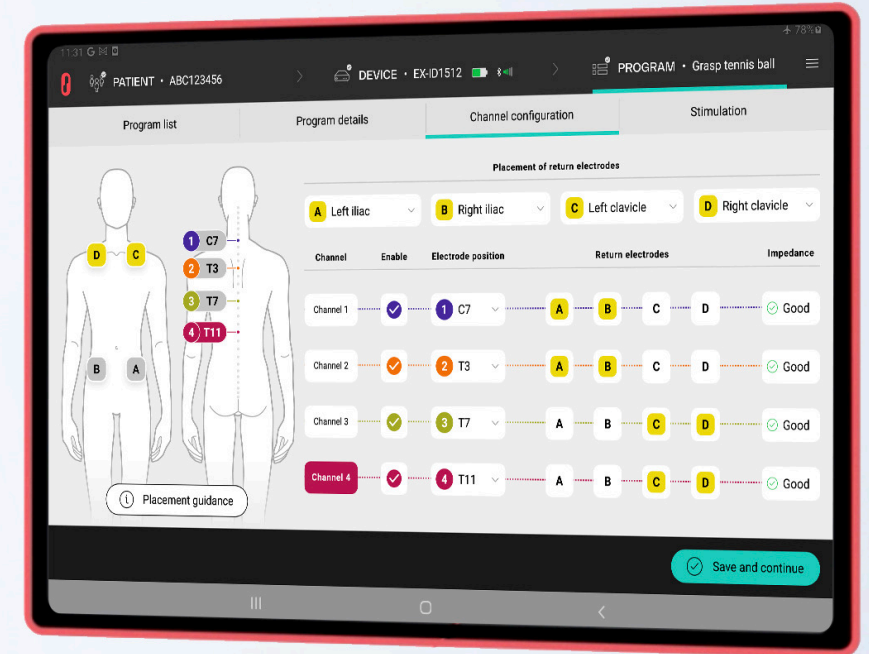

## Therapy

Designed to restore function in conjunction with rehabilitation

Intended to be used periodically during up to 60-minute sessions in the clinic or home

ARC<sup>EX</sup> Stimulator

ARC<sup>EX</sup> Programmer

## Mechanism of Action

Proprietary waveform: Strength to deliver current to the spinal cord without causing pain or discomfort

ARC **EX**

First indication: Strength  
and function of the hands  
and arms

Investigational implanted pulse generator and leads for direct, programmed stimulation of the spinal cord

# Implantable Platform

ARC 

# Spinal Cord Injury and improved blood pressure regulation

# Blood Pressure Indication

Improved hemodynamic control is important for the SCI population

Hemodynamic instability is highly prevalent, affecting almost 75% of people with SCI (nearly 500,000 people in the US & Europe)

The approach is also potentially applicable to those with Parkinson's disease

No rehabilitation is required

**nature**

Paper detailing our approach was published January 2021

ONWARD and partners receiving up to \$36M grant

ARC 

Next indication:  
Standing and  
walking

Ability to stand and walk restored in 9 participants with chronic injuries; even those with AIS-A severity

# Mobility - STIMO Trial

Clinically **Incomplete** Spinal Cord Injury

Clinically **Complete** Spinal Cord Injury

ClinicalTrials.gov Identifier: NCT02936453

Confidential

Strong relationships with leading patient advocacy organizations to drive awareness and market access

# Advocacy Organizations

## Opportunities for engagement

- Drive awareness in the SCI community
- Reach patients and their families directly
- Shared media and government advocacy
- Support for clinical research
- Sources of non-dilutive funding

# ONWARD & Brain Computer Interface

Targeted, programmed electrical stimulation of the spinal cord to restore movement, independence, and health in people with spinal cord injury

**ONWARD**<sup>™</sup> **EMPOWERING**  
**MOVEMENT**<sup>™</sup>

# Decoding neural signals to restore patients' lives

US Department of Commerce

MERCK

## CONTEXT

Graphene represents a material breakthrough in driving **neuroelectronic therapies at scale**

ALL INFORMATION CONTAINED IN THIS PRESENTATION IS CONFIDENTIAL AND IS PROTECTED BY COPYRIGHT INCLUDING KNOW-HOW

## GRAPHENE

- Nobel Prize Winner Material
- Thinnest Material Known to Man at One Atom Thick
- 200x Stronger Than Steel
- Flexible, Stretchable & Highly Impermeable
- Biocompatible
- Excellent conductor

*“What is important about graphene is the new physics it has delivered”*

**Geim, Nobel Prize 2010**

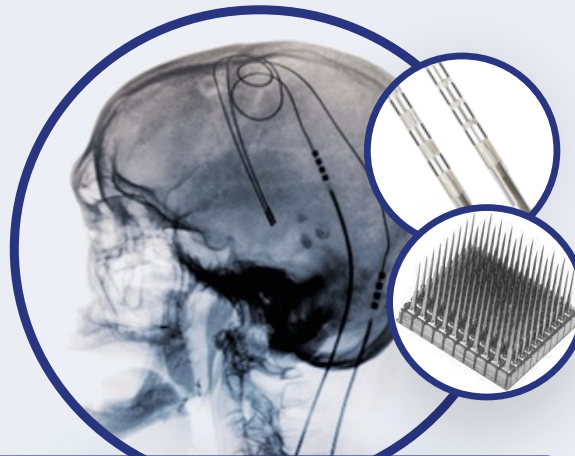

PROBLEM

# Current neuro & bioelectronic therapies are lagging behind

## INVASIVE TECHNOLOGY

Current therapies are highly invasive driving 50% patient rejection

## POOR OUTCOME REPRODUCIBILITY

Interfaces are made of metals with low count and resolution which impacts precision & patient to patient reproducibility<sup>1</sup>

## NOT PERSONALIZED

They don't consider patient or environment data and don't adjust to patient needs

1. Rolstone 2016

SOLUTION

# Graphene enables safe and intelligent neuroelectronic therapies at scale

## MINIMALLY INVASIVE

« Cell Like » size at an atom thick enabling miniaturization and modern electronics coupling

## BETTER OUTCOMES

Bi-directional, flexible, ultra high density & high resolution for biomarkers detection and therapy personalization (closed loop)

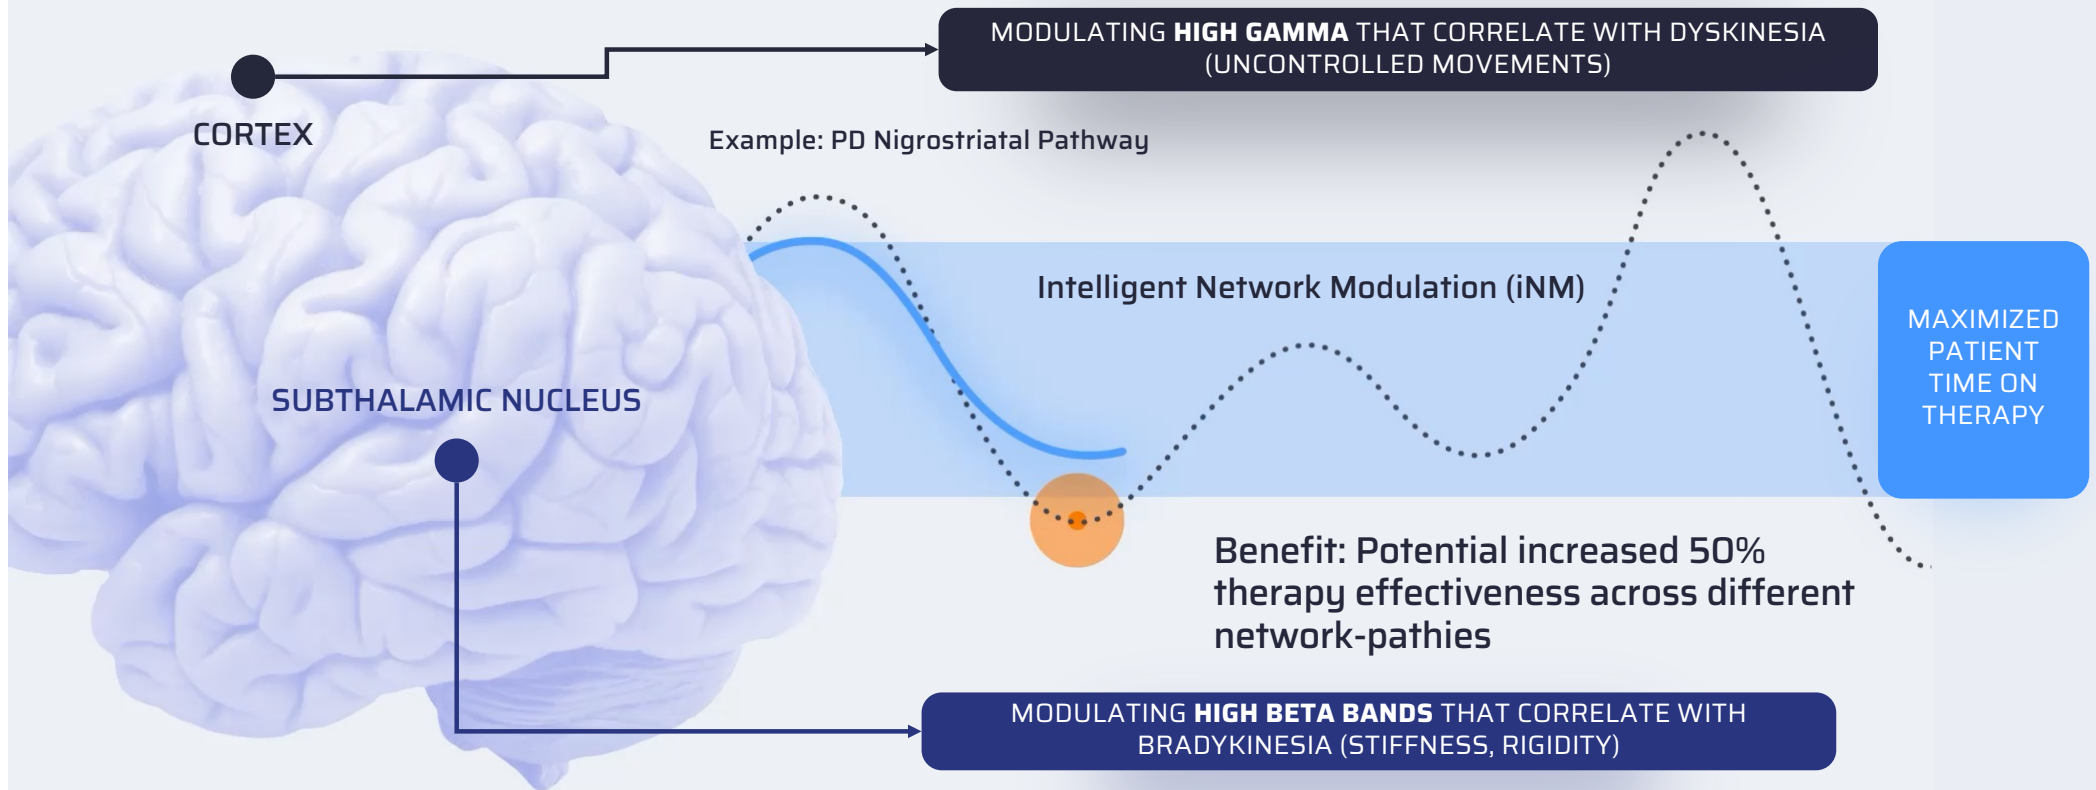

## PERSONALIZED

An intelligent implant that combines brain biomarker detection with patient lifestyle sensors data to deliver outcomes that matter to patients

SOLUTION

Our mission is to decode and modulate neural networks to maximize patient time on therapy

ALL INFORMATION CONTAINED IN THIS PRESENTATION IS CONFIDENTIAL AND IS PROTECTED BY COPYRIGHT INCLUDING KNOW-HOW

TECHNOLOGY

# These are the **graphene dots** that power our intelligent neuroelectronic system

## METAL TRADITIONAL

Metal & silicone technology with sub-optimal resolution

## GRAPHENE & BI-DIRECTIONAL

Graphene flexible and ultra-high resolution cortical & sub-cortical interfaces for recording and stimulation

### CORTICAL INTERFACE

### SUB-CORTICAL INTERFACE

## TECHNOLOGY

# EGNITE™ stands for Engineered Graphene for Neural Interfaces.

It is our patented Graphene innovation providing neurotechnological scalability

1. INBRAIN, Viana et al., Graphene-based thin film microelectrode technology for in vivo high-resolution neural recording and stimulation 2020 (in review at Nature Nanotechnology); Zhao et al., 2020, Nature Communications, Full activation pattern mapping by simultaneous deep brain stimulation and fMRI with graphene fiber electrodes

ALL INFORMATION CONTAINED IN THIS PRESENTATION IS CONFIDENTIAL AND IS PROTECTED BY COPYRIGHT INCLUDING KNOW-HOW

## HIGHER PATIENT ADOPTION

50% to 90%

reduced power requirements  
(consumption & battery space)

Thanks to 200x higher charge injection limit and ~10x lower impedance, enabling more efficient therapy and increased battery lifetime

## BETTER OUTCOMES

10x

more sensitive neural signal  
readouts<sup>1</sup>

Enabling improvement of neuroelectronic therapies via more sensitive neural signal recording and modulation

TECHNOLOGY

# Cortical Module

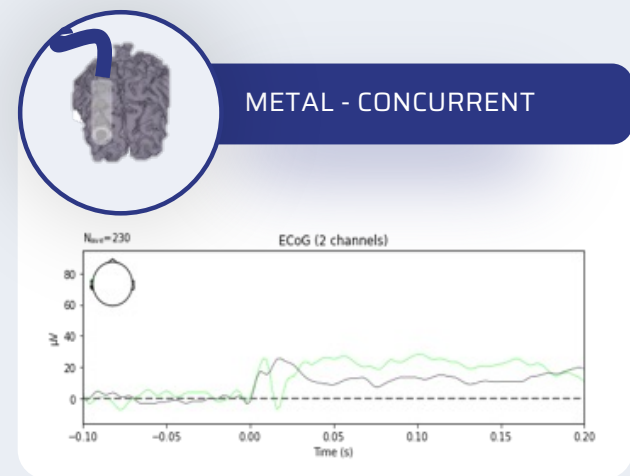

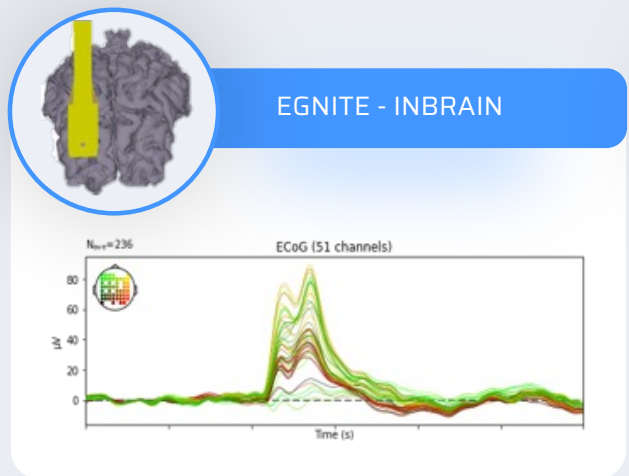

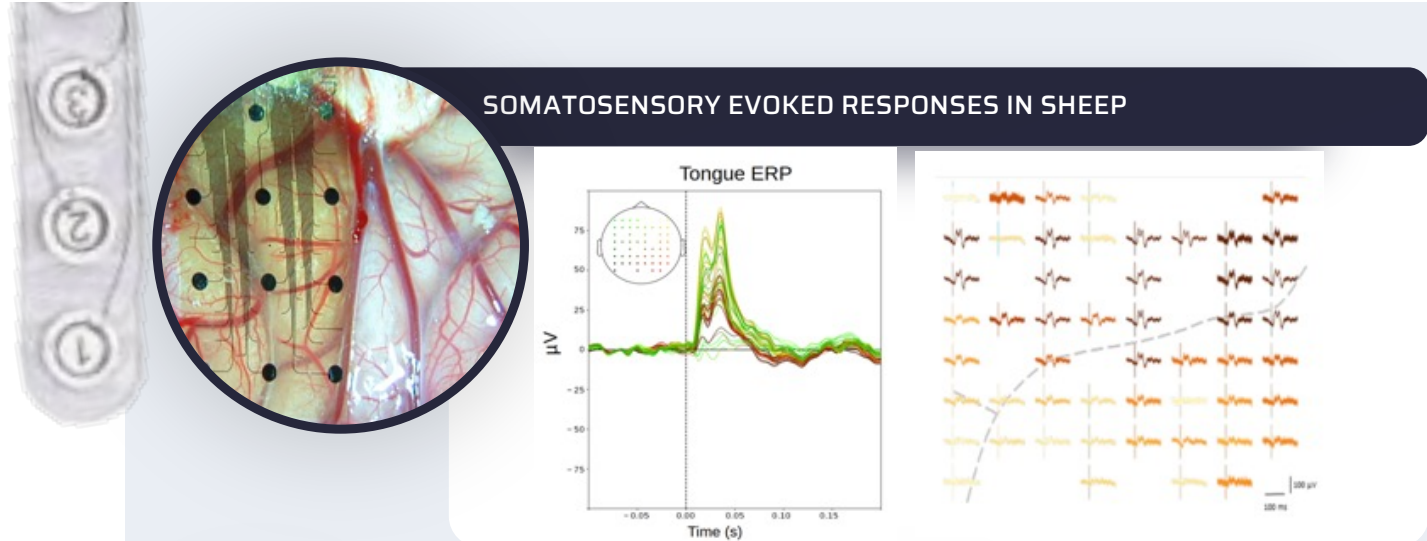

We outperformed SOTA\* both in small and large animal studies

At similar sizes, EGNITE provides 10X higher signal resolution than metals (Pt)

INBRAIN Data on file, Unpublished  
\* STANDARD OF THE ART

ALL INFORMATION CONTAINED IN THIS PRESENTATION IS CONFIDENTIAL AND IS PROTECTED BY COPYRIGHT INCLUDING KNOW-HOW

TECHNOLOGY

# Cortical Module

Graphene decodes what others can't

INBRAIN Data on file, Unpublished

ALL INFORMATION CONTAINED IN THIS PRESENTATION IS CONFIDENTIAL AND IS PROTECTED BY COPYRIGHT INCLUDING KNOW-HOW

Graphene 1mm dots showed much higher sensitivity to 50-150 Hz signals as compared to Pt

Additionally graphene 25  $\mu$ m dots showed the ability to sense low frequency signals as well as to detect higher frequency (>200 Hz) bursts.

High frequency might become an extremely relevant biomarker for STN interface lead localization and high precision in closed loop therapeutics.

TECHNOLOGY

# Cortical Module

## Graphene decodes what others can't

SOURCE: 1. Bonaccini Calia, A., Masvidal-Codina, E., Smith, T.M. et al. Full-bandwidth electrophysiology of seizures and epileptiform activity enabled by flexible graphene microtransistor depth neural probes. Nat. Nanotechnol. Dec 2021

# Cognixion ONE Assisted Reality Platform

Brain Computer Interface + Augmented Reality

# Hundreds of Millions Worldwide

# The Problem

**ALS/MND** affects more than 25,000 Americans per year and more than 500,000 worldwide.

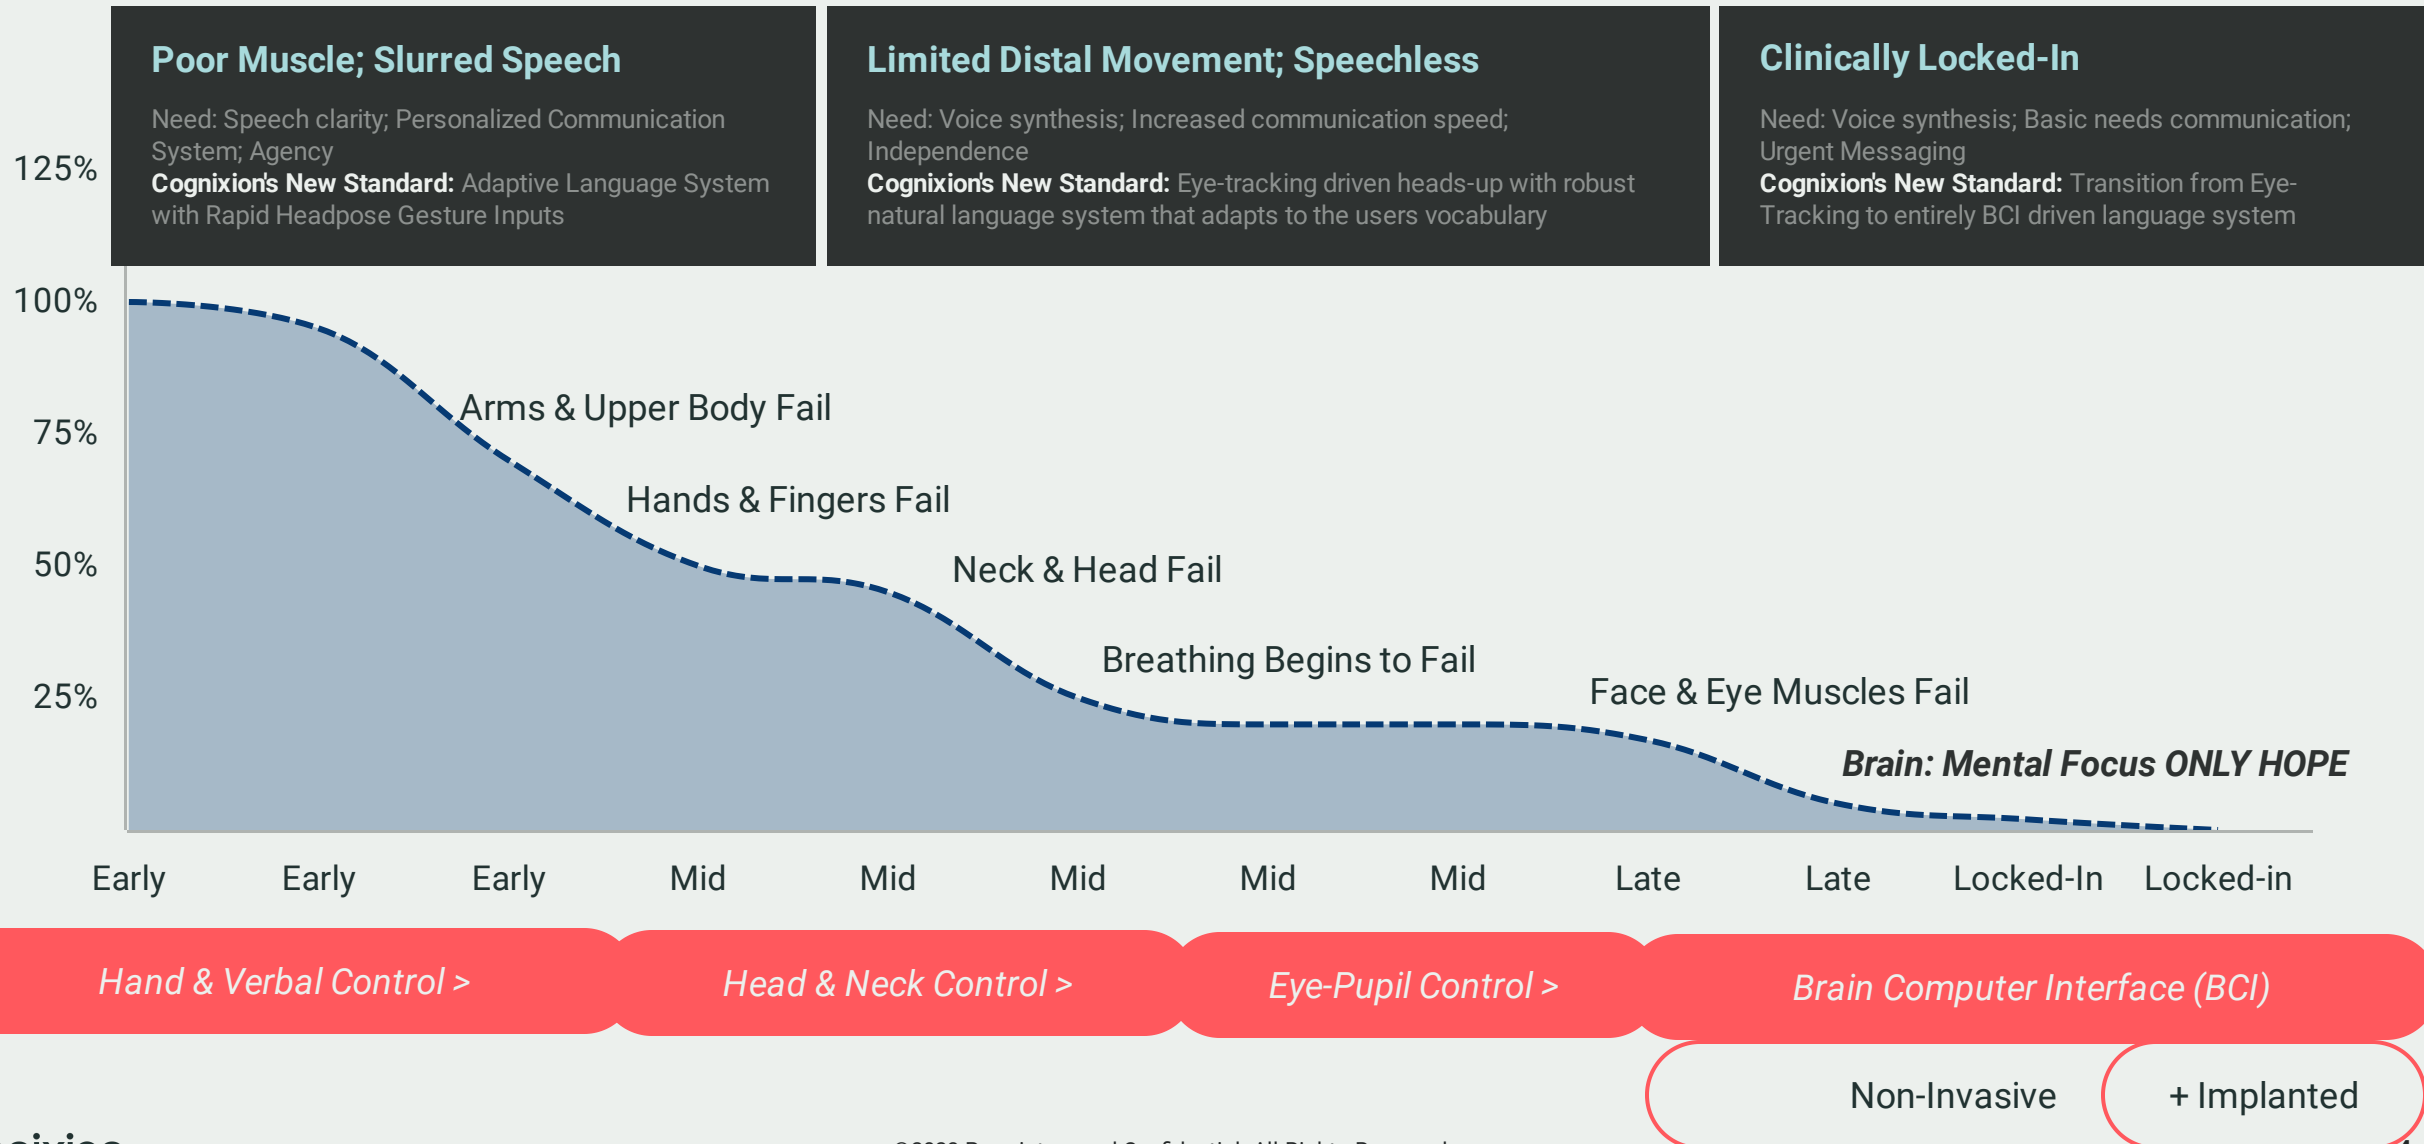

ALS is a progressive condition that leads to zero physical motor control with continuous cognition.

There are no HCI (Human Computer Interface) solutions that address the **entire** disease progression and patient journey.

ALS is our initial target but we expect to be able to apply our product to the hundreds of Millions of people with Motor, Speech & Language Disabilities worldwide.

# ALS - Progressive Decline of Motor Control requires Progressive Sensory Controls in *one system for end-to-end decline of motor function*

Cognixion's Natural Language Generation Platform addresses the needs of 1.6M disabled American adults, and 509 Million living with motor and speech disabilities globally

## Solving for ALS first enables us to expand the platform for other conditions as well as Mass Market Accessibility & Personalization of AR

### *Similar Needs as Early ALS*

Cerebral Palsy  
Multiple Sclerosis  
Stroke  
Aphasia

>500k Adults (USA only)

### *Similar Needs as Middle ALS*

Cerebral Palsy  
Huntington's  
Tetraplegia  
Cancer (Neck, Mouth, Throat)

>500k Adults (USA only)

### *Similar Needs as Late ALS*

Brainstem Stroke  
Parkinson's  
Traumatic Injuries  
Locked-In Syndrome

>10,000 Adults (USA only)

100% of the world population encounters situational communication impairments at some point

### *>1 Billion Adults*

Hands-Free, Voice-Free Human Machine Interaction While In Motion (vehicle, bicycle, sports)

### *>100 Million Adults*

Requiring Discrete Silent Human to Human or Human to Machine Communication (military, space, diving)

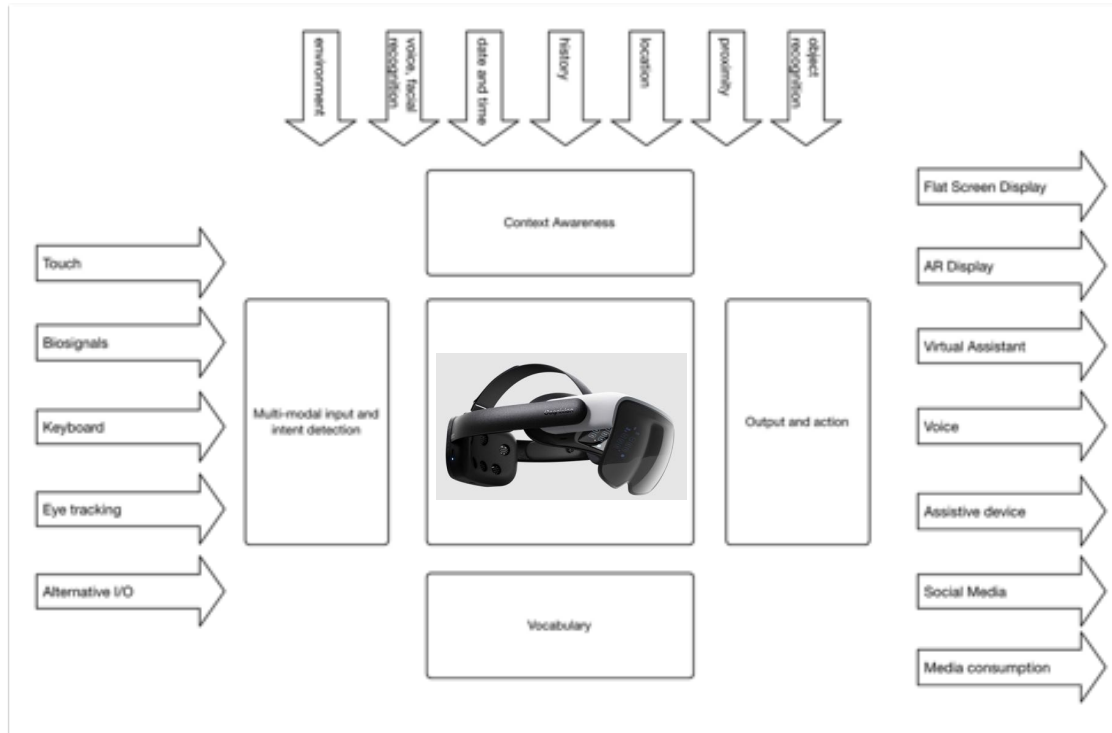

### *>100 Million Adults*

Require HMI without Any Body Motion (Covert or Tasks When Hands Are Occupied)

# OUR PLATFORM

Context aware system that can be deeply personalized to the person, which learns and adapts to their unique physiological and cognitive state and enhances their abilities in various situations.

Patent: US11237635B2

# Cognixion ONE BCI Principle of Operation

1. Visual Stimuli

2. User attention

3. Brain sensing

## Cognixion ONE

*Fully integrated BCI+AR system for Assisted Reality*

Wearable speech generation | Smart Home Controls | AI Companion/Assistant built-in

## Cognixion ONE

Augmented Communication  
& AI Companion

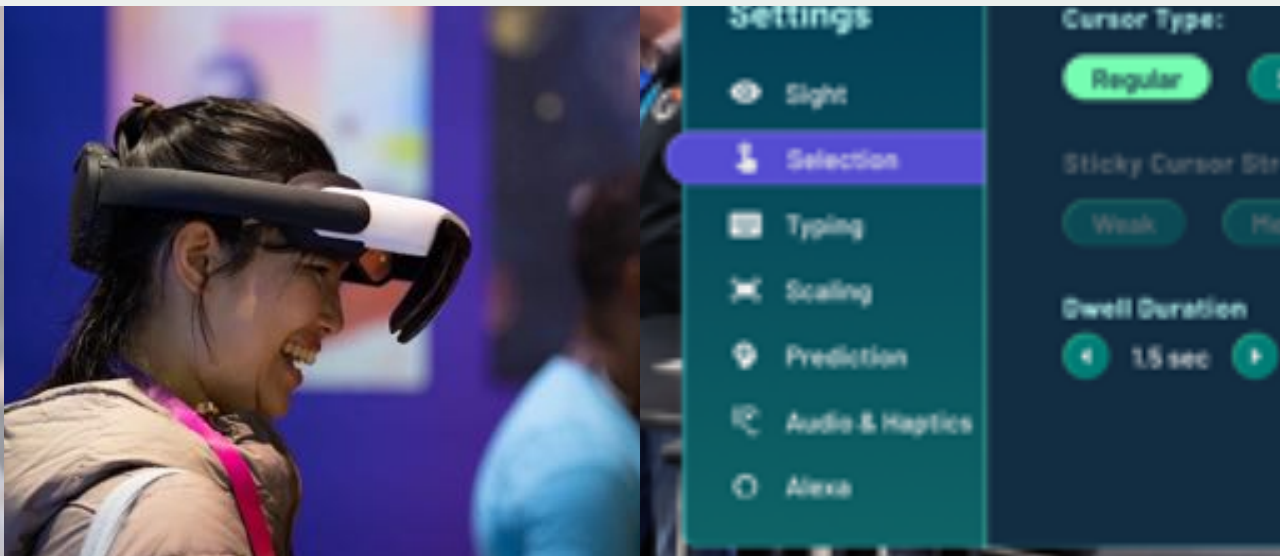

Independent Daily  
Active Living

Assisted Navigation &  
Mobility Control

**Creating the ultra-accessible world we all want to live in.**

# Adaptive and Personalized Experiences

# Clinical Efficacy

## ALS Patient Validation

- First in-home BCI technology validated with Clinically Locked-In ALS Patient without Eye Control & Caregiver training

***"Your device could make a huge difference for people with ALS"***

**- Spouse of ALS patient**

Executed IRB approved longitudinal field study in Sept-Oct. 2022

- 9 subjects across a variety of conditions including ALS, CP, Stroke, TBI

# The Assisted Reality Platform For Healthcare Market

The Wearable Computer for the Neural Interface Industry

## Interface

- **Wireless Switch & Handheld Controllers**
- Head Pointing
- Pupil Tracking
- Brain Sensing
- + API and UX specifically designed for Implantable BCI wireless integrations
- **...and more potential**
- Wireless data from implantable devices

## Applications

- **Speech Generation**
- AI Assistant Inside
- Smart Home Control
- Media Control
- Robot Control
- Mobility Control

Cognitive Biomarkers And Tracking

**DATA SIZE: Medium ~4000**

Brain-computer interface control  
and silent communication

**DATA SIZE: Large ~40M**

## The Problem: Current systems are bulky or have poor performance

### LABORATORY GRADE

---

- High Quality Signal
- Large Device
- Requires An Expert
- Not For Everyday Use

### CONSUMER GRADE

---

- Low Quality Signal
- Mobile
- Not For Continuous Use

**Solution: We need a high performance, everyday BCI that is used at scale**

# Solution: Neurable's Brain OS

- Neurable's IP enables the highest signal to noise ratio in EEG, and has been covered in [Nature](#), [Journal of Neural Engineering \(1,2\)](#) and [Taylor Francis' Journal on Brain Computer Interfaces \(BCI\)](#)
- Over 30 patents covering signal processing, software, sensor fusion and hardware
- Neurable's Brain OS Platform has been refined from data of over 4K participants over seven years

This differentiation allows Neurable to implement technology into **everyday devices** while still maintaining a **high level of signal to noise**

Our signal processing improvements (**Brain OS**) over the last 10 years have enabled us to build high-performance consumer-grade BCIs

2011

University of Michigan Signal Processing Breakthrough

2015

# Ruggedized Brain-Computer Interface for Cognitive Vitals

**NEURABLE** The mind.  
Unlocked.  
22.4D Phase 1 Contract#: FA864923P0207

## OVERVIEW.

Neurable's core technology is a **highly accurate and non-invasive EEG signal processing solution** powered by an AI engine that collects, cleans, and interprets EEG data alongside other biological signals to deliver actionable insights via API to commercial and defense end-user applications.

**Fatigue**, for example, is an insidious threat to aviation safety. In the last two decades, it has been identified as the probable cause of **21–23% of major aviation accidents**.

*Neurable's non-invasive EEG hardware + software solution is being adapted for the warfighter to monitor cognition, tracking fatigue, and improving human performance when it matters most.*

# The mind. Unlocked.

# The Starstim System: Noninvasive read/write platform

At-home  
TES-EEG with  
real-time remote  
supervision

Simple, easy-to-use design  
optimized for home use

---

Real-time remote access  
control and monitoring

---

Variety of waver forms for  
different applications

---

Simultaneous EEG recordings

---

Up to 32 independently-  
controlled stimulation  
electrodes

---

Platform covered by 7 issued  
U.S. and European patents

---

Manufactured in-house  
at Barcelona facility

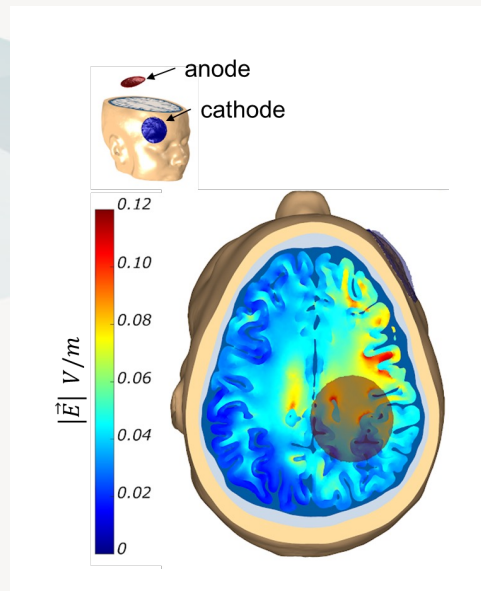

# Our Therapeutic Approach: Transcranial Electrical Stimulation (TES)

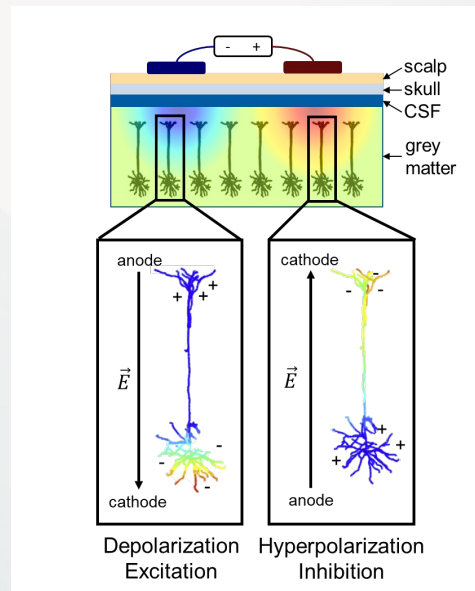

**Non-invasive** procedure in which a **low-intensity electrical** current is applied to the scalp via multiple electrodes

- Depending on electrode placement, technique can stimulate/suppress neuronal activity in highly specific regions of the brain to correct hypoactivity/hyperactivity
- Studied in >100 clinical trials involving >2,000 patients in a wide variety of CNS and other indications with well established safety profile

## Magnitude of Stimulation

## Mechanism of Action

Introduction of current generates electric field in the brain

Electric field couples with neurons, altering their membrane potential

Modulating neuronal firing patterns  
→ heightening/reducing excitability

Leading to synaptic remodeling  
→ “rewiring” the brain

Portable technology ideal for home use

# Key Advantage of TES: Safety

Similar mechanism of action to electroconvulsive therapy (ECT) and transcranial magnetic stimulation (TMS), but with much lower electrical fields involved

- Unlike fields generated in ECT and TMS, TES fields are sub-threshold – raise/lower probability of neuronal firing but do not “force” firing

---

Lower TES electric fields allow for more/longer dosing sessions without raising safety/tolerability concerns

Dosing Comparison – Typical Session

Metric (Units)	TES	TMS	ECT
Peak electric field in cortex, E (V/m)	0.2	150	400
Summed time per session, T (s)	1800	~1	0.2
Summed exposure per session, E*T (V*s/m)	360	150	80

---

**Safety meta-analysis** by Antal et al (2017) found **no reports of serious adverse events** in over 18,000 patient administrations of TES

# Integrated EEG Monitoring Functionality Enables More Complete TES Solution

## Safe, non-invasive technique for recording various types of electrical activity within the brain

- Used to diagnose/monitor a wide variety of CNS conditions (e.g., epilepsy, stroke, sleep disorders)

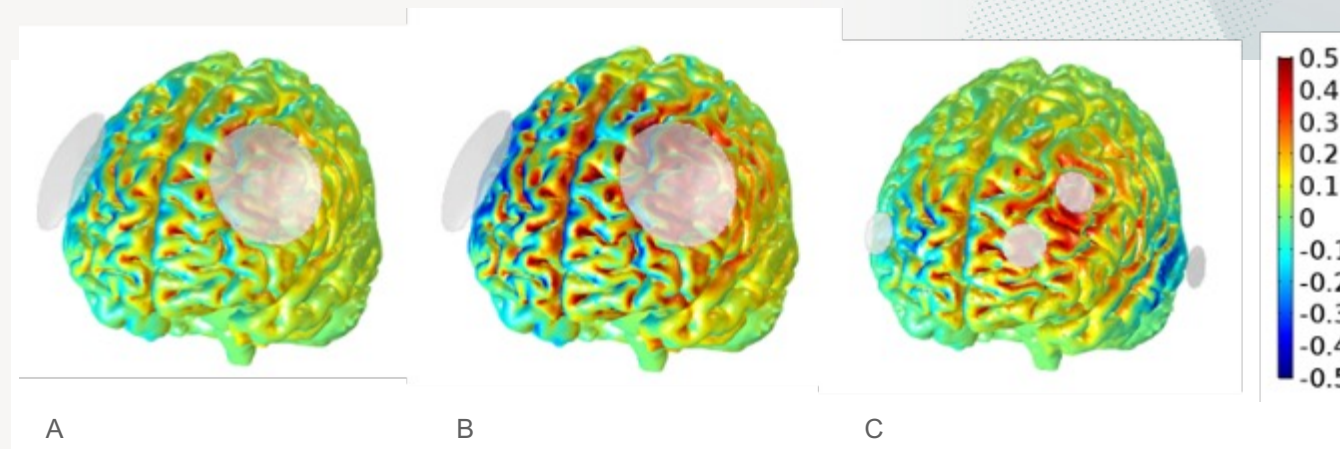

## Currently under investigation as a **potential biomarker** in multiple CNS indications

- Diagnostic applications in Parkinson's Disease, Alzheimer's Disease, and ADHD (Ruffini 2019, Rodrigues-Brazete 2016, Motolaisir 2010, Dubreuil-Vall 2020)
- Baseline EEG can predict response to antidepressant medications (Wu 2020)
- Treatment-emergent EEG signatures can predict response to TMS therapy (Isserles 2018)

Necessary element of any **“closed loop” solution** in which TES treatment dynamically and automatically adapts to real-time electrophysiological data

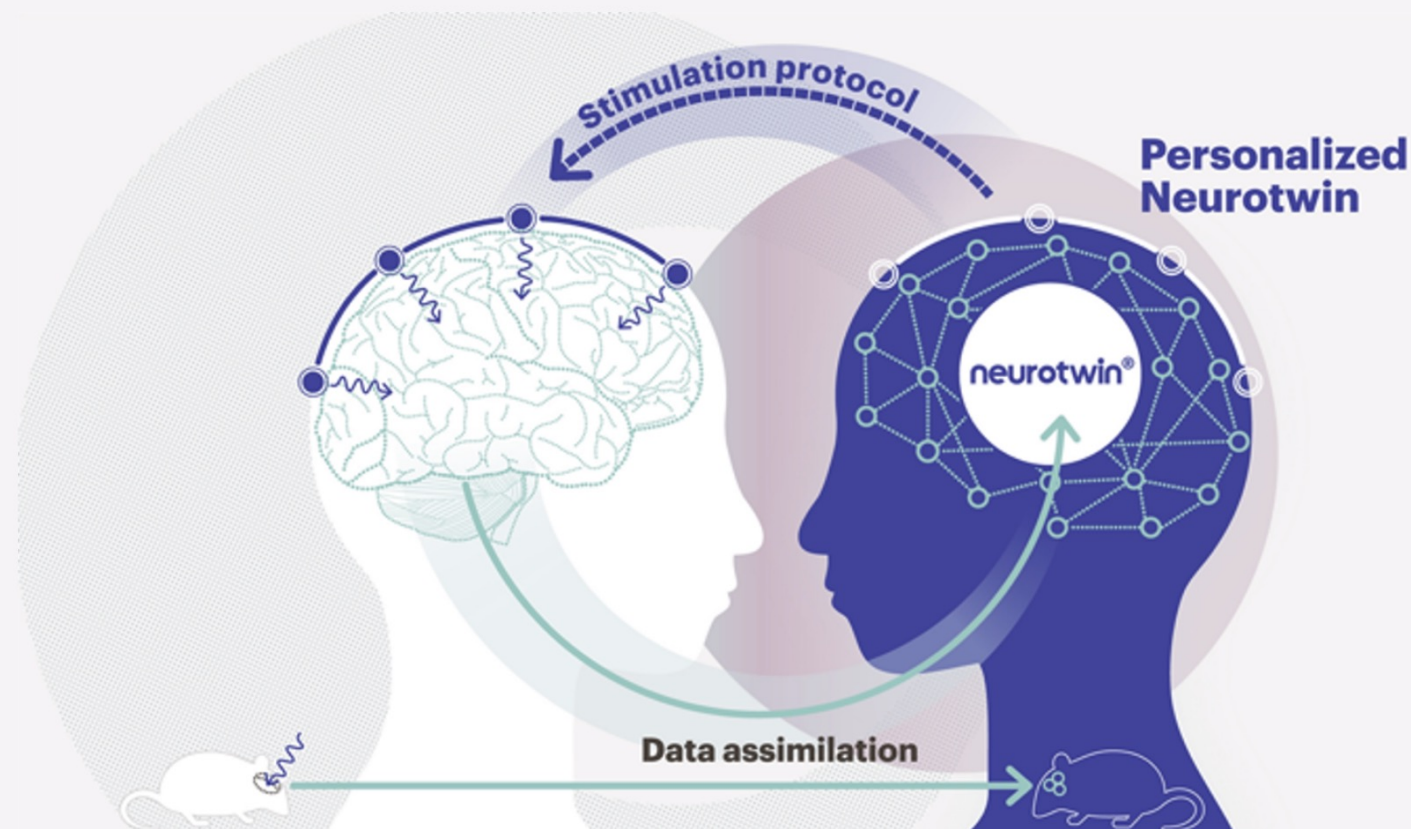

# Key Competitive Advantage: Precision

- Traditional bi-polar (two-electrode) approach: “active” anode/(cathode) placed directly over single localized area targeted for neural excitation/(inhibition); return electrode placed over “inactive” area  
Relatively large electrodes: surface area typically 25-35cm<sup>2</sup>
- Starstim multichannel approach: up to 32 bi-directional electrodes ( $\pi$  cm<sup>2</sup> surface area), each with independently-controlled currents  
Current focal epilepsy and at-home MDD trials utilize 8-channel/39-position version of Starstim device for ease-of-use
- Multichannel montages enable more precise solutions for small, multiple and extended cortical targets  
Minimal off-target E-fields and multiple electrodes allow higher total current → higher on-target E-fields, lower off-target E-fields

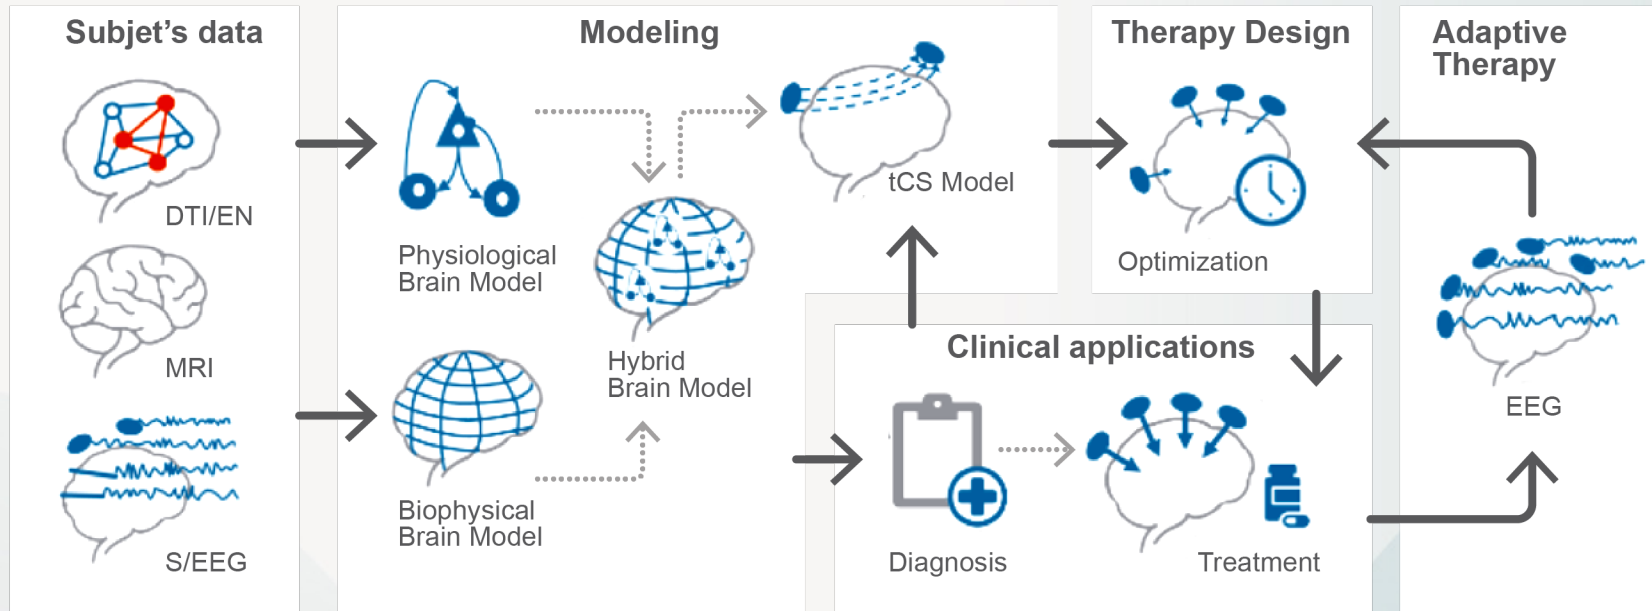

Estimated normal E-field distribution for typical F3/F4 experimental MDD montage with standard 2.0 mA/electrode current limit (image A); normal E-field distribution for F3/F4 montage with electrode current limit raised to 3.1 mA (image B) to match total current of Neuroelectrics multichannel MDD montage; normal E-field distribution for 4-electrode montage used in Neuroelectrics MDD pilot study (image C). Translucent disks represent electrodes.

## Neurotwin: Building digital copies of your brain

# Neurotwin: Truly Personalized Medicine

Workflow for the creation of hybrid models model-driven tES optimization. DTI and anatomical MRI data are combined to create a finite element biophysical model (FEM), which is then personalized using EEG, SEEG, EN and other data to reflect both biophysical and physiologic characteristics – from excitation/inhibition balance to plastic potential (long-term effects physiological model). The personalized hybrid brain model can be used to generate EEG and to simulate the effects of brain stimulation. As a result, personalized diagnosis and treatment can be applied, such as optimized stimulation protocols. Since tES protocols are typically multisession, EEG data collected over time (e.g., at the patient's home using telemedical solutions) can be used to refine models and adapt the stimulation protocols (target map, dosing).

NE®

MRI

neuroelectrics®

# Epilepsy

NE  
neuroelectrics®

Co-Principal Investigator  
Dr. Alexander Rotenberg

# Epilepsy Pilot Study Design

Open-label study in pediatric and adult subjects with medically-refractory, focal epilepsy (N=20)

- Two sites: Boston Children's Hospital and the National Institute of Neurology and Neurosurgery (Mexico City)
- Co-PIs: Alexander Rotenberg, M.D., Ph.D. (BCH, HMS) and Mouhsin Shafi, M.D., Ph.D. (BIDMC, HMS)

---

10 20-minute in-clinic TES sessions over 2 weeks

- TES treatment montages personalized to patient baseline EEG and MRI to ensure focality

---

8-week mandatory follow-up period; many patients followed through week 12

---

Primary endpoint: seizure frequency reduction from 8-week baseline to 8-week follow-up

# Starstim Treatment Paradigm

## Step 1: Diagnosis

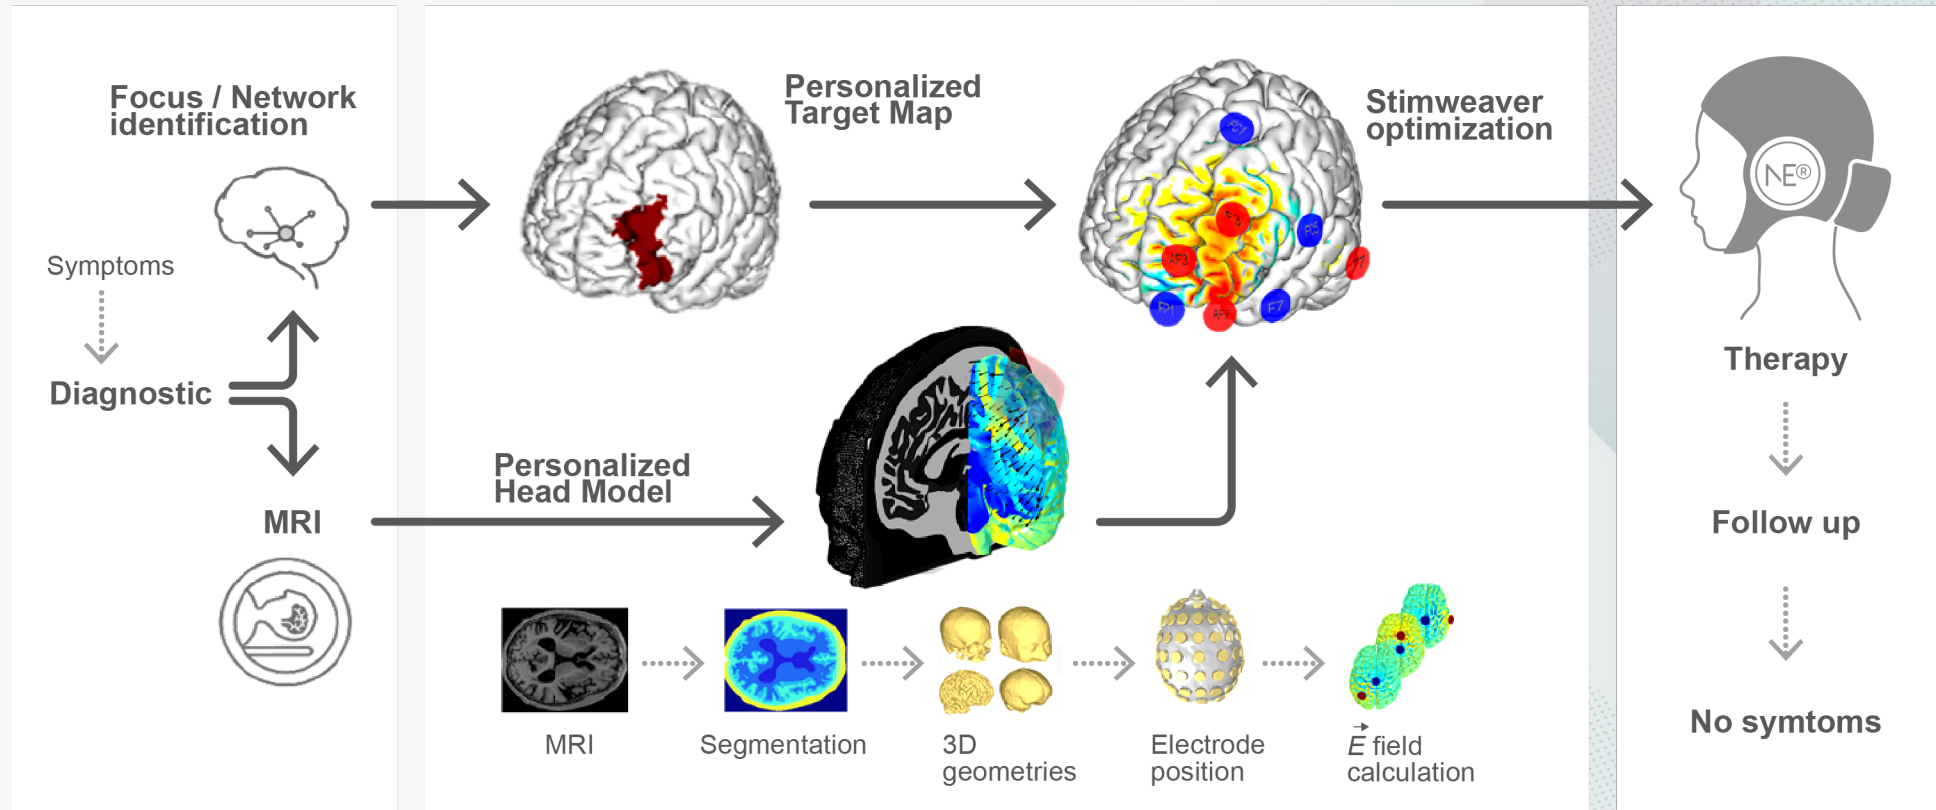

Electrophysiological focus of disorder identified by doctor using MRI, EEG, etc.

## Step 2: Personalization

Neuroelectronics builds individual brain/head model and calculates optimal protocol montage.

## Step 3: Treatment

Personalized protocol montage downloaded into hardware; treatment begins.

# Starstim Treatment Paradigm

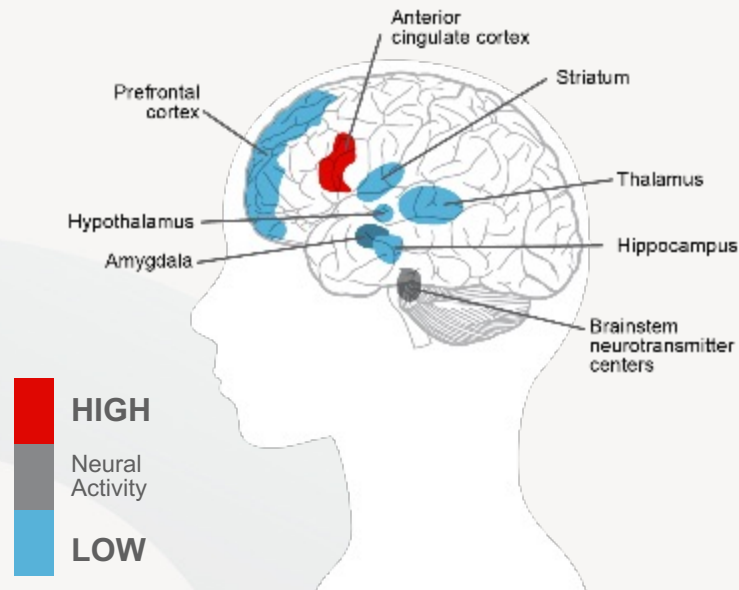

# REDUCING SEIZURES BY 47%

# Follow-On Indication: Depression FDA IDE study

## Major Depressive Disorder (MDD)

In MDD, some areas of the brain are **Hypoactive** and others are **Hyperactive**

## Target indication: refractory MDD

- 1.9M U.S. refractory patients; >28M globally
- Therapeutic alternatives include TMS, VNS, ECT

## Mechanistic rationale

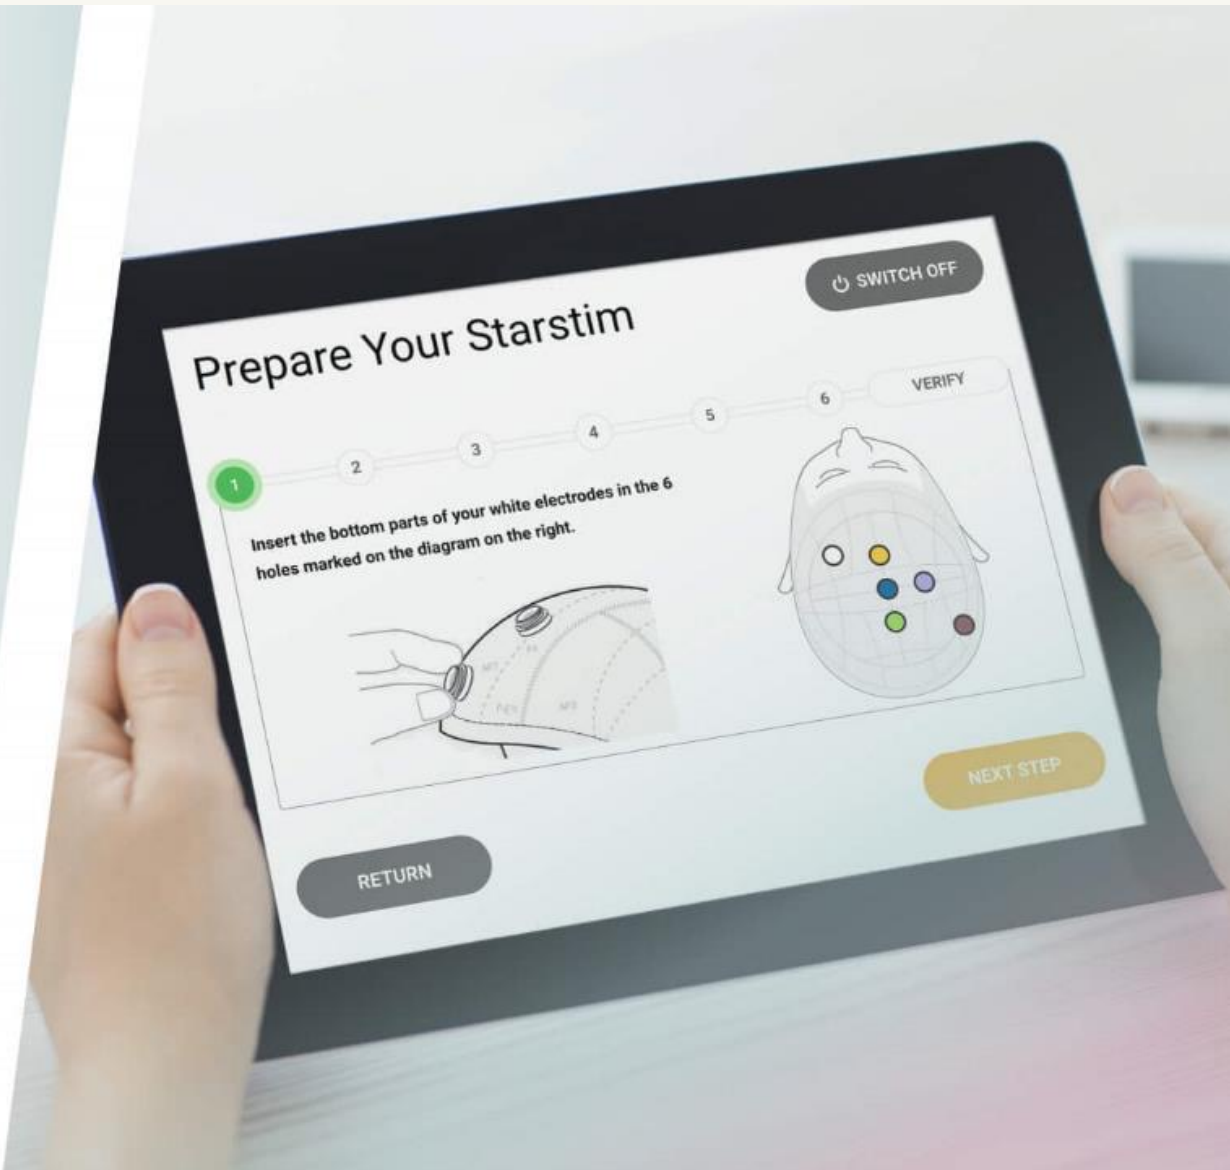

- MDD characterized by reduced left vs right neuronal activity in dorsolateral prefrontal cortex (DLPFC)
- Application of neuromodulatory electric field on left DLPFC stimulates neuronal activity in this region, restoring electrophysiological function
- Plasticity from repeated application believed to lead to healthy rewiring of fronto-limbic network

## Protocol

- 30 patient, open-label, 12-week safety/feasibility study in refractory MDD
- 37 at-home TES sessions administered by patient with help from caregiver
- 30-min sessions; 2.0mA total injected current limit across all electrodes
- Primary efficacy endpoint: change in MADRS score
- Secondary endpoints: QIDS-SR, QLES-Q-SF, CogState

# Some discussion issues

- On the ethical side would be good to have a set of guidelines like for IBI taking issues like responsibility, data privacy, identity and equity.
- The FDA has been amazing, but some questions remain on the regulation of personalization pieces like Neurotwin. Brain therapy at home still has some open issues.
- In general the complexity, cost and time to market of non invasive technologies for patient population is still a big burden for most innovators/entrepreneurs and patients are waiting.
- There are 15k users in reddit doing self stimulation and a potential increase of consumer devices in similar technologies to increase memory, learning or others.

# A Risk Based Approach for Medical Devices since 1976

## **Class I** **Low Risk**

- Generally exempt from premarket review
- In some cases require 510(k) / De Novo

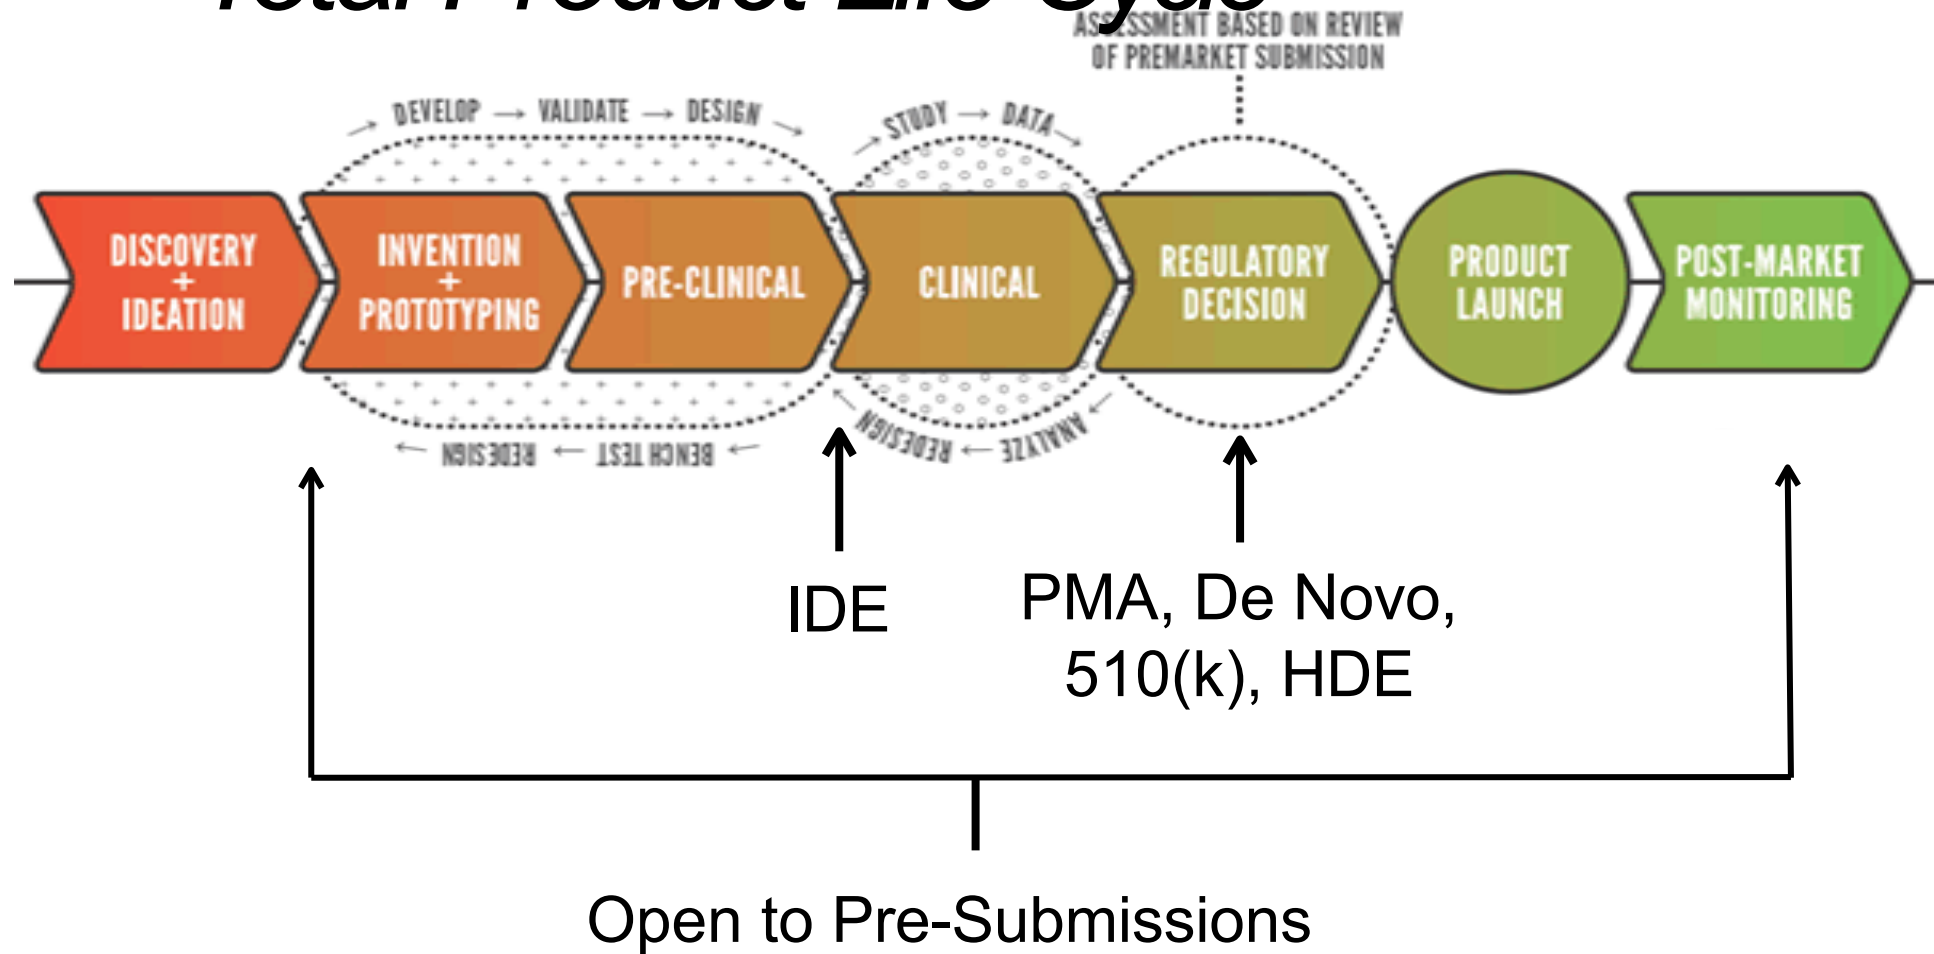

## **Class II** **Moderate/Controlled Risk**

- Requires 510(k) to demonstrate substantial equivalence
- OR De Novo if no classification exists

## **Class III** **High Risk**

- Requires PMA (Premarket approval)
